Emerging Strategies in Combatting and Managing Bacterial Biofilms Reham Wasfi,Samira Mohamed Hamed,Ashraf Zarkan,2023-08-25 Biofilm formation is a survival strategy for many microorganisms Within biofilms microorganisms live in multicellular communities enclosed in a protective matrix that enables them to survive harsh conditions and resist conventional treatments The ability of biofilm forming microorganisms to inhabit different biotic and abiotic surfaces facilitates their widespread existence in different environments including health care facilities water systems ships and even living hosts Hence this microbial phenotype became a major concern in various sectors including public health medicine and industry The challenge imparted by the detrimental effects of biofilms has sparked the interest of many researchers in tackling this problem Biofilms are not simply a collection of microorganisms but can be considered as new materials Current research efforts have focused on understanding the mechanisms of biofilm formation and factors affecting their structures as well as innovative approaches for combating biofilms and achieving rapid biofilm detection Prevention and proper

management of biofilms necessitates a deep understanding of the mechanisms of their formation and the factors affecting their development. It is established that biofilm formation undergoes multiple stages from initial surface adhesion to maturation and dispersion. However, how bacteria trigger, regulate and modulate each stage is not yet well understood. Additionally, early detection of biofilms facilitates early intervention and consequently reduction in the economic loss and clinical burden. However, detection of cells within biofilms is particularly challenging and innovative sensing, tracking and diagnostic technologies are needed. Clinically, biofilm formation is a key aspect of antibiotic resistance. Biofilms are not merely protective barriers against antibiotics and the host immune system but also harbour non-growing persister bacteria that survive antibiotics by virtue of their dormancy. It is established that both persisters and biofilms are implicated in chronic infections. However, the triggering factors of their formation are not fully understood. Viable but non-culturable VBNC cells are another group of non-growing bacteria that can inhabit biofilms and remain dormant for extended periods. The trigger for their formation and revival as well as clinical relevance is unclear.

### **Signal Transduction in Stomatal Guard Cells**

Agepati S Raghavendra, Yoshiyuki Murata, 2017-05-03. Stomata, the tiny pores on leaf surface, are the gateways for CO<sub>2</sub> uptake during photosynthesis as well as water loss in transpiration. Further, plants use stomatal closure as a defensive response often triggered by elicitors to prevent the entry of pathogens. The guard cells are popular model systems to study the signalling mechanism in plant cells. The messengers that mediate closure upon perception of elicitors or microbe-associated molecular patterns (MAMPs) are quite similar to those during ABA effects. These components include reactive oxygen species (ROS), nitric oxide (NO), cytosolic pH and intracellular Ca<sup>2+</sup>. The main components are ROS, NO and cytosolic free Ca<sup>2+</sup>. The list extends to others such as G proteins, protein phosphatases, protein kinases, phospholipids and ion channels. The sequence of these signalling components and their interaction during stomatal signalling are complex and quite interesting. The present e-Book provides a set of authoritative articles from Special Research Topic on selected areas of stomatal guard cells. In the first set of two articles, an overview of ABA and MAMPs as signals is presented. The next set of 4 articles emphasize the role of ROS, NO, Ca<sup>2+</sup> as well as pH as secondary messengers. The next group of 3 articles highlight the recent advances on post-translational modification of guard cell proteins with emphasis on 14-3-3 proteins and MAPK cascades. The last article describes the method to isolate epidermis of grass species and monitor stomatal responses to different signals. Our e-Book is a valuable and excellent source of information for all those interested in guard cell function as well as signal transduction in plant cells.
