Control Systems Design of Bio-Robotics and Bio-Mechatronics with Advanced Applications Ahmad Taher

Azar,2019-11-30 Control Systems Design of Bio Robotics and Bio Mechatronics with Advanced Applications delivers essential and advanced bioengineering information on the application of control and robotics technologies in the life sciences Judging by what we have witnessed so far this exciting field of control systems and robotics in bioengineering is likely to produce revolutionary breakthroughs over the next decade While this book is intended for senior undergraduate or graduate students in both control engineering and biomedical engineering programs it will also appeal to medical researchers and practitioners who want to enhance their quantitative understanding of physiological processes Focuses on the engineering and scientific principles underlying the extraordinary performance of biomedical robotics and bio mechatronics Demonstrates the application of principles for designing corresponding algorithms Presents the latest innovative approaches to medical diagnostics and procedures as well as clinical rehabilitation from the point of view of dynamic modeling system analysis and control Robotics, Vision and Control Peter Corke,2011-11-03 The practice of robotics and computer vision both involve

the application of computational algorithms to data Over the fairly recent history of the fields of robotics and computer vision a very large body of algorithms has been developed However this body of knowledge is something of a barrier for anybody entering the field or even looking to see if they want to enter the field What is the right algorithm for a particular problem and importantly How can I try it out without spending days coding and debugging it from the original research papers The author has maintained two open source MATLAB Toolboxes for more than 10 years one for robotics and one for vision The key strength of the Toolboxes provide a set of tools that allow the user to work with real problems not trivial examples For the student the book makes the algorithms accessible the Toolbox code can be read to gain understanding and the examples illustrate how it can be used instant gratification in just a couple of lines of MATLAB code The code can also be the starting point for new work for researchers or students by writing programs based on Toolbox functions or modifying the Toolbox code itself The purpose of this book is to expand on the tutorial material provided with the toolboxes add many more examples and to weave this into a narrative that covers robotics and computer vision separately and together The author shows how complex problems can be decomposed and solved using just a few simple lines of code and hopefully to inspire up and coming researchers The topics covered are guided by the real problems observed over many years as a practitioner of both robotics and computer vision It is written in a light but informative style it is easy to read and absorb and includes a lot of Matlab examples and figures The book is a real walk through the fundamentals of robot kinematics dynamics and joint level control then camera models image processing feature extraction and epipolar geometry and bring it all together in a visual servo system Additional material is provided at <http://www.petercorke.com> RVC **Practical Manual for**
