Student Exploration: Refraction

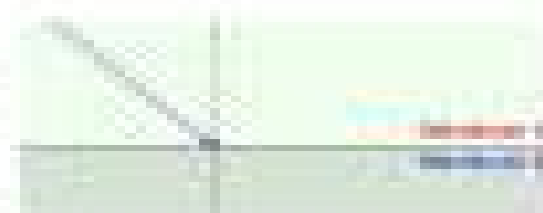

Learning Goals: Explain the relationship between the angle of incidence, angle of refraction, and the refractive index of a medium. Predict the direction of light rays when they pass from one medium to another.

Prerequisite Knowledge: Students should understand the concept of light rays and how they travel in straight lines.

1. What would happen if a light ray traveled from air into water? Would it bend? If so, how would it bend?

2. How would the light ray bend if it traveled from water into air? Would it bend? If so, how would it bend? Would it bend more or less than when it traveled from air into water?

Student Exploration: Light rays travel in straight lines. When a light ray travels from one medium to another, it bends. This bending is called refraction. The amount of bending depends on the refractive index of the two media. The refractive index is a measure of how much a medium slows down light. Light travels faster in air than in water, so it bends towards the normal when it enters water.

Teacher Background: The refractive index of a medium is a measure of how much it slows down light.

3. A light ray travels from air into water. What happens to the ray?

a. Does the ray bend? If so, how does it bend?

b. Does the ray bend? If so, how does it bend? Is it bent more or less than when it traveled from water into air?

Teacher Background: Light rays bend towards the normal when they enter a medium with a higher refractive index.

4. A light ray travels from water into air. What happens to the ray? Does it bend? If so, how does it bend? Is it bent more or less than when it traveled from air into water? Is it bent more or less than when it traveled from water into water?

hearing: Part 1 sound enforcement prof. ibrahim elnoshokaty, Everyday your world is filled with a multitude of sounds

Sound can let you communicate with others or let others communicate with you. It can be a warning of danger or simply an enjoyable experience. Some sounds can be heard by dogs or other animals but cannot be heard by humans. The ability to hear is definitely an important sense, but people who are deaf are remarkable in the ways that they can compensate for their loss of hearing. All of the sounds you can hear from plucking the strings above occur because mechanical energy produced by your computer speaker was transferred to your ear through the movement of atomic particles. Sound is a pressure disturbance that moves through a medium in the form of mechanical waves. When a force is exerted on an atom, it moves from its rest or equilibrium position and exerts a force on the adjacent particles. These adjacent particles are moved from their rest position, and this continues throughout the medium. This transfer of energy from one particle to the next is how sound travels through a medium. The words mechanical wave are used to describe the distribution of energy through a medium by the transfer of energy from one particle to the next. Waves of sound energy move outward in all directions from the source. Your vocal chords and the strings on a guitar are both sources which vibrate to produce sound waves. Without energy, there would be no sound. Let's take a closer look at sound waves.
