*EGFR-TKIs for Lung Cancer Treatment: Development, Application, and Side Effects* Qinglin Shen, Shengxi Chen, Hexiao Tang, 2025-06-03 Lung cancer is the malignant tumor with the highest incidence and mortality rate in the world With the in depth research of molecular biology and the development of targeted drugs targeted therapy has changed the pattern of lung cancer treatment In 2004 mutations in the epidermal growth factor receptor EGFR were discovered and successfully combined with the development of small molecule tyrosine kinase inhibitors TKIs ushering in the era of targeted therapy for non small cell lung cancer NSCLC After nearly 20 years of development three generations of EGFR TKIs have been widely used in clinical practice bringing significant benefits to patients prolonging survival and improving quality of life Molecular targeted therapy has good molecular selectivity which can efficiently and selectively kill tumor cells and reduce damage to normal tissues The adverse reactions of EGFR TKIs treatment for lung cancer are different from those of traditional treatments such as surgery radiotherapy and chemotherapy Targeted therapy has completely changed the diagnosis and treatment mode of lung cancer and improved the quality of life of patients However targeted therapy will eventually lead to drug resistance and more or less adverse reactions during the treatment process The efficacy and safety of EGFR TKIs in the treatment of lung cancer remain of utmost importance Besides the three generations EGFR TKIs that have already been clinically applied we urgently need to develop novel efficient and low toxicity EGFR TKIs Therefore we expect to explore the development application and side effects of EGFR TKIs for lung cancer So as to extend the overall survival and improve the quality of life The focus of this Research Topic is to explore the EGFR TKIs treatment for lung cancer These may include but are not limited to 1 Development of EGFR TKIs of lung cancer 2 Application of EGFR TKIs to lung cancer 3 Side effects of EGFR TKIs of lung cancer Please note Manuscripts consisting solely of bioinformatics computational analysis or predictions of public databases which are not accompanied by validation independent clinical or patient cohort or biological validation in vitro or in vivo which are not based on public databases are not suitable for publication in this journal

*Inflammation in Respiratory and Neurological Diseases and the immune-interaction of the lung-brain axis* Xiaohuan Xia, 2024-01-18 Despite great advances in diagnosis and treatment that we witnessed in the last

decades over a billion people suffer from both respiratory and neurological diseases each year which poses great threats to the public health and economic burden worldwide In many instances the underlying pathogenic mechanisms are still poorly understood which significantly limits the efficacy of therapeutic methods In this regard lines of evidence pinpoint the important role of immunity and inflammation in both respiratory disorders e g pulmonary hypertension chronic obstructive pulmonary disease asthma etc and neurological ones e g neurodegenerative diseases stroke depression etc The accumulation of inflammatory cells and an excess of cytokines and chemokines at the inflammatory site would result from the disturbance of the body's delicate balance between immunity and tolerance Therefore it gives rise to chronic inflammation and autoimmunity underlying the development of both lung and neurological diseases Furthermore the inflammation interaction between lung and brain has been identified suggesting the existence and importance of the lung brain axis in the regulation of immune responses in the lung and brain that contribute to the onset and progression of both respiratory and neurological diseases Nevertheless inflammatory or immunity related risk factors as well novel targets and therapies against inflammation or immunity help early diagnosis and treatment of respiratory and neurological diseases At present the full picture of the molecular mechanisms of how immuno inflammatory activation and the immune cells orchestrate the tissue remodeling leading to respiratory and neurological diseases remains unclear The identification of inflammatory molecules as therapeutic targets or biomarkers are worth further scrutiny to halt the disease progression and monitor the therapeutic interventions
