results of ultrasound molecular imaging with BR55 a kinase insert domain receptor KDR targeted contrast microbubble in patients with breast and ovarian lesions have been reported in 2017 Taking advantage of microbubble cavitation effect ultrasound assisted drug delivery technology also makes great progress The clinical trial of blood brain barrier disruption for chemotherapy delivery in the brain had been conducted and confirmed its safety and well toleration in patients with recurrent glioblastoma GBM Moreover ultrasound provides an advantageous tool for image guided therapy due to its capability of real time imaging for deep tissues contributing to greatly improved localization and targeting of diseased tissues More interestingly by imaging these drug loaded contrast agents ultrasound mediated drug delivery can be visualized All of the above examples help demonstrate the promising potential of ultrasound in precision medicine not only for disease diagnosis but also for treatment selection and prognosis evaluation The present Research Topic here in Frontiers in Pharmacology aims to bring a collection of research describing ultrasound used for precision medicine in diagnosis drug delivery and image guided therapy
