RESOLUTION

Resolution is the machine's ability to detect and display accurately.

2 main types of resolution: SPATIAL(space) and TEMPORAL(time)

Spatial resolution: the machine's ability to distinguish between 2 closely spaced objects and display them separately. The spatial resolution will be measured in space or distance (mm)

Axial and Lateral

Axial = vertical

Lateral = horizontal

Axial = $1/2$ SPL

2 vertical objects *parallel or along axis of pulse*

LARRD (longitudinal, axial, radial, range, depth)

Minimum distance 2 vertical objects must be separated by to be resolved = $1/2$ SPL

In this example:

SPL of 1.8mm = Axial res of 0.9mm
The 2 objects are separated by 1mm. They are separated by the minimum distance = resolved!

SPL of 2.2mm = Axial res of 1.1mm
The same 2 objects no longer meet the requirements = blurred together vertically

Even though 2 echoes are produced, the echoes are blended because the pulse is longer

GOAL: shorten the pulse

- Increase frequency
Decreases wavelength = decreases pulse
- Damping/backing material
Reduces ringing of crystal = shortens the pulse
- Wide Bandwidth = shorter pulse (lo Q)
