

Experiment No. 2:**PENSKY MARTEN'S FLASH POINT APPARATUS**

AIM: To determine the flash point of lubricating oil by Pensky Marten's apparatus.

APPARATUS: Pensky Marten's apparatus, thermometers.

THEORY:

In the Pensky-Martens closed cup flash point test, a brass test cup is filled with a test specimen and fitted with a cover. The sample is heated and stirred at specified rates depending on what it is that's being tested. An ignition source is directed into the cup at regular intervals with simultaneous interruptions of stirring until a flash that spreads throughout the inside of the cup is seen. The corresponding temperature is its flash point.

Pensky-Martens closed cup is sealed with a lid through which the ignition source can be introduced periodically. The vapour above the liquid is assumed to be in reasonable equilibrium with the liquid. Closed cup testers give lower values for the flash point (typically 5-10 K) and are a better approximation to the temperature at which the vapour pressure reaches the Lower Flammable Limit (LFL).

Outline of Method: the sample is heated in a test cup at a slow and constant rate with continuous stirring. A small test flame is directed into the cup at regular intervals with simultaneous interruptions of stirring. The flash point is taken as the lowest temperature at which the application of the test flame causes the vapour above the sample to ignite momentarily.
