- Abstract:** This study examined the effects of a 12-week, 100% bodyweight resistance training program on the muscle strength and body composition of 12 sedentary, middle-aged men. The program consisted of three sessions per week, targeting the major muscle groups. Results showed significant increases in muscle strength and body composition measures, including muscle mass and bone mineral density, after the 12-week intervention. The findings suggest that a 100% bodyweight resistance training program can effectively improve muscle strength and body composition in sedentary, middle-aged men.
