Teaching General Chemistry Mansoor Niaz, 2008 The main objective of this monograph is to incorporate history and philosophy of science in the chemistry curriculum in order to provide students an overview of the dynamics of scientific research which involves controversies conflicts and rivalries among scientists that is the humanising aspects of science A major thesis of this book is the parallel between the construction of knowledge by the students and the scientists In looking

for this relationship it is not necessary that ontogeny recapitulate phylogeny but rather to establish that students can face similar difficulties in conceptualising problems as those faced by the scientists in the past Given the vast amount of literature on students alternative conceptions misconceptions in science it is plausible to suggest that these can be considered not as mistakes but rather as tentative models leading to greater conceptual understanding Just as scientists resist changes in the hard core of their beliefs by offering auxiliary hypotheses students may adopt similar strategies Conceptual change in science education can thus be conceptualised as building of tentative models that provide greater explanatory power to students understanding

Metaphor and Analogy in Science Education Peter J. Aubusson, Allan G. Harrison, Stephen M. Ritchie, 2006-06-28 Years ago a primary teacher told me about a great series of lessons she had just had The class had visited

rock pools on the seashore and when she asked them about their observations they talked about it was like a factory it was like a church it was like a garden it was like our kitchen at breakfast time etc Each student's analogy could be elaborated and these analogies provided her with strongly engaged students and a great platform from which to develop their learning about biological diversity and interdependence In everyday life we learn so many things by comparing and contrasting The use of analogies and metaphors is important in science itself and their use in teaching science seems a natural extension but textbooks with their own sparse logic do not help teachers or students David Ausubel in the 1960s had advocated the use of advance organisers to introduce the teaching of conceptual material in the sciences and some of these had an analogical character However research on the value of this idea was cumbersome and indecisive and it ceased after just a few studies In the 1980s research into children's conceptions of scientific phenomena and concepts really burgeoned and it was soon followed by an exploration of a new set of pedagogical strategies that recognised a student in a science class is much more than a tabula rasa
