Taxonomy, Systematic, and Phylogeny

Phylogeny—evolutionary history of a species or group of species

Hypotheses about phylogenetic relationships from:

Fossil Record—Timing of evolutionary divergences

Homologous morphological traits

Behaviors

Molecular Sequences

Convergent evolution— species from different evolutionary branches develop similar **analogous** adaptations due to similar environments

Analogous traits evolve independently

Similarities do not provide information about evolutionary relationships

Systematics classifies organisms and determines their evolutionary relationships

Taxonomists assign each species a binomial consisting of a **genus** and **species** name

Phylogenomic Discordance in Plant Systematics Stefan Wanke, Susann Wicke, 2023-11-15 Phylogenetics often uncovers contradicting hypotheses regarding the relationships within the same group of organisms a phenomenon known since the beginning of the molecular systematics era While historically single marker based analyses produced discordance nowadays entire cellular genomes or portions of the same genomic compartment conflict with others or the rest respectively In contrast to the beginning of the molecular systematics era when adding markers and taxa offered a way out of systematic errors genome inference based incongruences cannot be addressed and explained easily Disagreeing phylogenomic hypotheses might originate from various evolutionary processes including but not limited to hybridization or incomplete lineage sorting thereby leading to gene tree versus species tree associated discrepancies Today this can be expanded to genome discordance where phylogenomic signals of organellar genomes plastid mitochondrial and the nuclear genome disagree due to intrinsically different coalescent paths or phenomena like organelle capture
