

62B.2.3 PILOT VALVE OPERATION

The pilot valve consists of two valve body assemblies (one is for main valve's boom spool operation and the other for bucket spool operation). The both of these valve body assemblies operate basically the same.

Each valve body assembly is provided with two plungers and two discharge ports. The discharge ports are communicating to the pilot ports of the main valve.

The valve body assembly for boom spool operation has a pump port (P), and that for bucket spool operation a tank port (T). These body assemblies each have a pump port passage and tank port passage formed inside.

The pilot valve is, in regard to its operation, roughly divided into the oil pressure regulating section and the electromagnetic detent section.

1. Operation at Oil Pressure Regulating Section

(1) In neutral (See Fig. 62B.9)

When the loading lever is in neutral, hydraulic oil flowing from the pump port (P) is blocked by the shuttle.

In this state, the discharge port (OUT) is open to the tank port (T) so that the oil pressure does not act on the pilot port of the main valve.

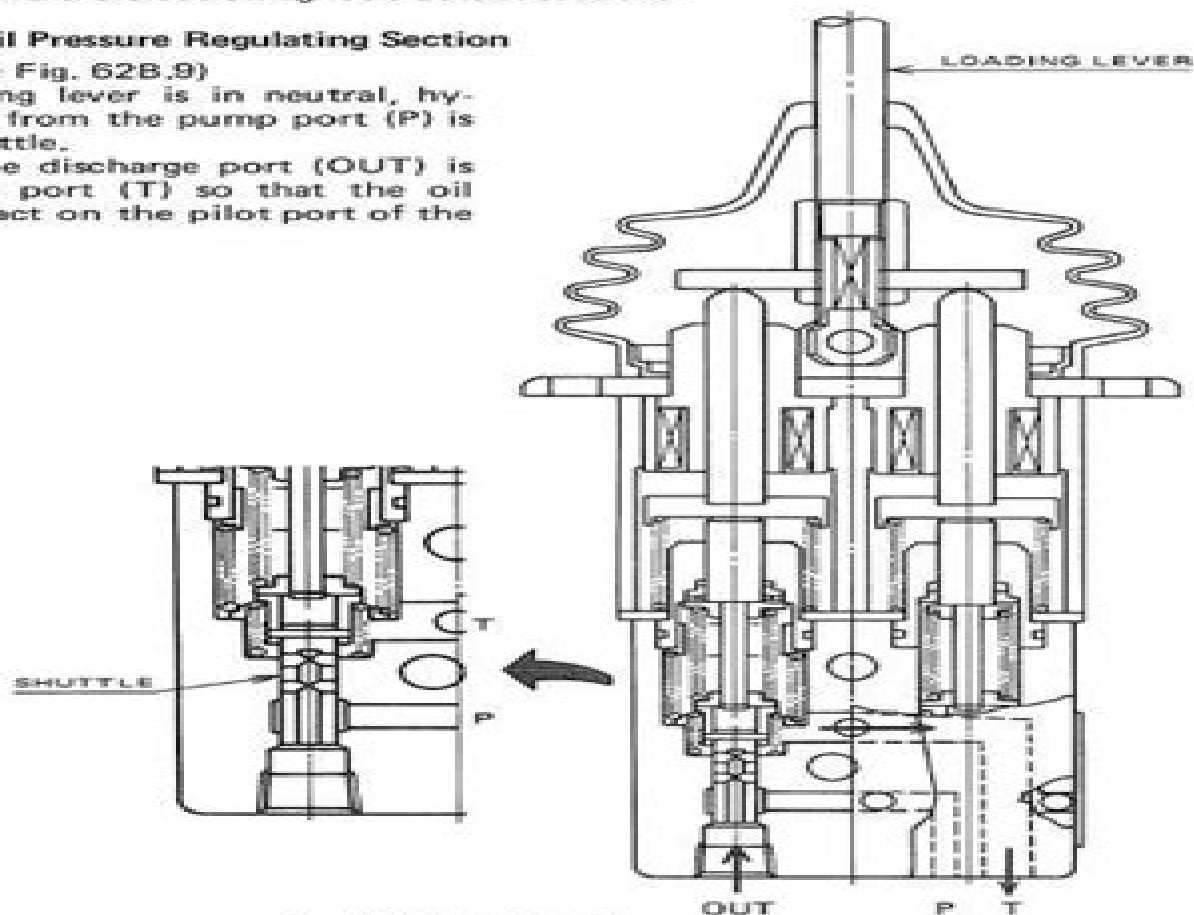

Fig. 62B.9 In Neutral
