

Laboratory Activity #1 — Student Laboratory Packet

Relationships and Biodiversity*A Laboratory Activity for the Living Environment***Introduction**

Botana curus is a valuable plant because it produces Curol, a compound used for treating certain kinds of cancer. Curol cannot be produced in the laboratory. *Botana curus* grows very slowly and is on the endangered species list, so its ability to provide Curol in large quantities is limited.

Species that are more closely related to *Botana curus* are more likely to produce the important substance Curol. Three similar plant species that are plentiful (X, Y, and Z) may be related to *Botana curus*. You will work as a researcher to:

- gather structural and molecular evidence to determine which plant species is most closely related to the hypothetical species, *Botana curus*
- use this evidence to decide which plant species is most likely to serve as a source of the important substance Curol

Safety

- You will need to wear goggles while conducting Tests 4 and 5.
- Do not eat or drink anything in the laboratory while doing this laboratory activity.

Important Note: Record all of your data and answers on these laboratory sheets. You will need to keep them for review before the Regents Examination. Later, you will need to transfer your answers to a separate Student Answer Packet. Your teacher will use the packet in grading your work, and the school will retain it as evidence of your completion of the laboratory requirement for the Living Environment Regents Examination.

Structural Evidence for Relationships

Perform the following tests and record your observations in Table 1 on page 8 of this packet. Use a hand lens or microscope as needed.

Test 1-Structural Characteristics of Plants

- Do not remove the plant samples from the plastic bags/cards.
- Compare the structural characteristics of the plant samples. Record your observations in Table 1 (see page 8).

Test 2-Structural Characteristics of Seeds

- Do not remove the seed samples from the plastic bags/cards.
- Compare the structural characteristics of the seed samples. Record your observations in Table 1.

"Relationships and Biodiversity" is a laboratory activity produced by the State Education Department for use in fulfilling part of the laboratory requirement for the Regents Examination in Living Environment. Reproducing any part of this laboratory activity by other than New York State school personnel is illegal. Handbook of Climate Change and Biodiversity Walter Leal Filho, Jelena Barbir, Richard Preziosi, 2018-08-28 This book comprehensively describes essential research and projects on climate change and biodiversity Moreover it includes contributions on how to promote the climate agenda and biodiversity conservation at the local level Climate change as a whole and global warming in particular are known to have a negative impact on biodiversity in three main ways Firstly increases in temperatures are detrimental to a number of organisms especially those in sensitive habitats such as coral reefs and rainforests Secondly the pressures posed by a changing climate may lead to sets of responses in areas as varied as phenology range and physiology of living organisms often leading to changes in their lifecycles especially but not only in reproduction losses in productivity or even death In some cases the very survival of very sensitive species may be endangered Thirdly the impacts of climate change on biodiversity will be felt in the short term with regard to some species and ecosystems but also in the medium and long term in many biomes Indeed if left unchecked some of these impacts may be irreversible Many individual governments financial institutes and international donors are currently spending billions of dollars on projects addressing climate change and biodiversity but with little coordination Quite often the emphasis is on

adaptation efforts with little emphasis on the connections between physio ecological changes and the lifecycles and metabolisms of fauna and flora or the influence of poor governance on biodiversity As such there is a recognized need to not only better understand the impacts of climate change on biodiversity but to also identify test and implement measures aimed at managing the many risks that climate change poses to fauna flora and micro organisms In particular the question of how to restore and protect ecosystems from the impact of climate change also has to be urgently addressed This book was written to address this need The respective papers explore matters related to the use of an ecosystem based approach to increase local adaptation capacity consider the significance of a protected areas network in preserving biodiversity in a changing northern European climate and assess the impacts of climate change on specific species including wild terrestrial animals The book also presents a variety of case studies such as the Yellowstone to Yukon Conservation Initiative the effects of climate change on the biodiversity of Aleppo pine forest in Senalba Algeria climate change and biodiversity response in the Niger Delta region and the effects of forest fires on the biodiversity and the soil characteristics of tropical peatlands in Indonesia This is a truly interdisciplinary publication and will benefit all scholars social movements practitioners and members of governmental agencies engaged in research and or executing projects on climate change and biodiversity around the world
