

THE ENDOCRINE SYSTEM

Gland/Endocrine Gland	Function
Hypothalamus	Controls the pituitary gland and releases hormones that regulate the body.
Pituitary Gland	Releases hormones that control the growth and development of the body.
Thyroid Gland	Releases thyroid hormones that regulate the body's metabolism.
Parathyroid Gland	Releases parathyroid hormone that regulates the body's calcium levels.
Adrenal Gland	Releases hormones that regulate the body's stress response.
Testes	Releases testosterone that regulates the body's male sex characteristics.
Ovaries	Releases estrogen that regulates the body's female sex characteristics.

The endocrine system is made up of several glands.

A gland is an organ that produces and releases chemicals.

Some glands, such as endocrine glands, release chemicals into the blood, or they "secrete".

These chemicals then travel through the bloodstream to places in the body called the "target" glands. Endocrine glands release chemicals directly into the blood.

 A diagram of a human figure from the front, with various glands highlighted in red. The glands shown include the hypothalamus and pituitary gland in the brain, the thyroid and parathyroid glands in the neck, the adrenal glands (one on top of each kidney), the pancreas in the abdominal area, and the testes in the male reproductive system.
