Truseq Enrichment Guide:

Identifying Novel Inborn Errors of the Immune System Elisabeth Salzer, 2017-01-03 In her study Elisabeth Salzer describes three novel monogenic diseases For CD27 deficiency Elisabeth Salzer describes a large cohort of patients Although all patients shared the same causative missense mutation they displayed diverse clinical presentations In another patient she was able to identify a mutation in PRKCD resulting in a primary immunodeficiency with severe Lupus like autoimmunity The patient exhibited increased mRNA levels of IL6 Therefore treatment with Tocilizumab a humanized anti IL 6 receptor monoclonal antibody was suggested In a family with a history of deaths due to inflammatory bowel disease she identified a missense mutation in IL21 She produced wild type and mutated IL 21 protein and demonstrated a loss of function phenotype As IL 21 is in clinical trials she proposed a potentially curative treatment option These discoveries contributed to the understanding of the multifaceted regulatory mechanisms of the immune system and highlighted essential players in these complex signaling networks

Organ Abscission: From Models to Crops Timothy J. Tranbarger,Mark L. Tucker,Jeremy A. Roberts,Shimon Meir,2017-11-22 Plant organ abscission is a developmental process regulated by the environment stress pathogens and the physiological status of the plant In particular seed and fruit abscission play an important role in seed dispersal and plant reproductive success and are common domestication traits with important agronomic consequences for many crop species Indeed in natural populations shedding of the seed or fruit at the correct time is essential for reproductive success while for crop species the premature or lack of abscission may be either beneficial or detrimental to crop productivity The use of model plants in particular Arabidopsis and tomato have led to major advances in our understanding of the molecular and cellular mechanisms underlying organ abscission and now many workers pursue the translation of these advances to crop species

Organ abscission involves specialized cell layers called the abscission zone AZ where abscission signals are perceived and cell separation takes place for the organ to be shed A general model for plant organ abscission includes 1 the differentiation of the AZ 2 the acquisition of AZ cells to become competent to respond to various abscission signals 3 response to signals and the activation of the molecular and cellular processes that lead to cell separation in the AZ and 4 the post abscission events related to protection of exposed cells after the organ has been shed While this simple four phase framework is helpful to describe the abscission process the exact mechanisms of each stage the differences between organ types and amongst diverse species and in response to different abscission inducing signals are far from elucidated For an organ to be shed AZ cells must transduce a multitude of both endogenous and exogenous signals that lead to transcriptional and cellular and ultimately cell wall modifications necessary for adjacent cells to separate How these key processes have been adapted during evolution to allow for organ abscission to take place in different locations and under different conditions is unknown The aim of the current proposal is to present and be able to compare recent results on our understanding of organ abscission from model and crop species and to provide a basis to understand both the evolution of abscission in plants and the translation of advances with model plants for applications in crop species

Herbivorous insects such as piercing sucking hemipteran insects and chewing Lepidopteran insects must establish close associations with their host plants in order to modulate plant cellular processes to promote feeding and reproduction In response to herbivore attacks plants have developed a complex immune system such as plant signalings plant resistant genes and plant secondary metabolite A sophisticated molecular arms race between plants and insects involves the interaction between different molecules from plants and insects The secondary metabolite and resistant genes of plants can be used as defense tools against the infestation of insects In contrast the various types of detoxification enzymes and effectors from insects can interfere with plant defense at multiple levels for better adaptation These metabolite substances and resistant genes of plants and detoxification enzymes and effectors of insects are involved in complex networks of genetic physical metabolic and molecular interactions between plants and insects And these molecules and genes can be identified by the new omics technologies including genome transcriptome proteome metabolomics and so on Omics analyses have provided new insights and understanding into the relationships between plants and insects as well as the underlying molecular mechanisms of their interactions Understanding the molecular interaction between plants and insects can help develop new and improved plant resistant varieties and novel green control strategies
