Tuberculosis is a common and in many cases lethal infectious disease caused by various strains of mycobacteria such as *Mycobacterium tuberculosis*. Tuberculosis typically attacks the lungs but can also affect other parts of the body. The classic symptoms are a chronic cough with blood tinged sputum, fever, night sweats, and weight loss. *Tuberculosis: A Comprehensive Clinical Reference* serves as a useful reference for individuals working in biomedical laboratories and for clinical professionals. It provides the latest research you need to know about tuberculosis. There are totally 10 chapters in this book. Chapter 1 highlights health systems weaknesses that are hampering diseases control efforts and proposes possible health system strengthening interventions that can easily be implemented. Strengthened health systems are essential for the control of tuberculosis. Chapter 2 proposes an original model for preparing and dispensing the drugs and monitoring of patients with tuberculosis under a direct observed treatment (DOT) program. It also includes the results and analysis of the model after the implantation. Chapter 3 shows the associated cost to an original program of Direct observed treatment (DOT) using the perspective of the Spanish Health Care System and comparing for each case of DOT the cost of a Self administered Treatment (SAT) based on a theoretical model. Chapter 4 reviews the present scenario of Multi Drug Resistance Tuberculosis (MDR TB) and the advantages of newer molecular approaches for the laboratory diagnosis of MDR TB with special reference to Rifampicin resistance as a surrogate marker for it. Chapter 5 mainly focuses on the algorithmic approach in diagnosis of tuberculosis related uveitis. It also gives key points in the pathogenesis, clinical manifestations, and treatment of tuberculosis related uveitis. Pulmonary tuberculosis can lead to various forms of complications. It can be categorized as parenchymal, airway, vascular, pleural lesions, and general complications. Chapter 6 describes the pathogenesis, clinical manifestations, diagnostic criteria, and management of complications of pulmonary tuberculosis. Chapter 7 discusses *Mycobacterium tuberculosis* complex in human beings. Tuberculosis in humans is caused mainly by two of the seven closely related bacteria within *Mycobacterium tuberculosis* complex (MTBC), namely *Mycobacterium tuberculosis* (MTB) and *Mycobacterium africanum* (MAF). Chapter 8 aims on difficulties of anti TB chemotherapy especially for Urogenital Tuberculosis and discusses the way to

minimise the side effects Chapter 9 aims on improving in time diagnosis of extrapulmonary tuberculosis and particularly urogenital tuberculosis by making clear its features Chapter 10 deals with the comparative genomics bioinformatic analyses and genome wide screening approaches for the better understanding of these immunologically important proteins and summarizes that PEPPE domain from mycobacteria belongs to the family of serine hydrolase proteins and the phylogenetic analysis has shown that *Mycobacterium tuberculosis* is of recent decent

HIV and Tuberculosis Irini Sereti, Gregory P. Bisson, Graeme Meintjes, 2019-11-30 Globally HIV associated tuberculosis is one of the most important causes of infection related death accounting for one in every three HIV deaths and over 300 000 in 2017 alone The HIV epidemic has undermined tuberculosis control efforts in many countries around the world as the virus has important modifying effects on the pathogenesis diagnosis and treatment of TB The management of HIV associated TB is also complicated by rapid clinical progression immune reconstitution inflammatory syndrome drug drug interactions and shared toxicities The past two decades have yielded thousands of research publications and review articles on HIV associated TB HIV and Tuberculosis A Formidable Alliance consolidates this massive amount of data into a single resource With contributions from myriad disciplines including epidemiology immunology public health and clinical medicine this book provides well rounded and thorough coverage that will appeal to researchers and clinicians alike

Towards individualised treatment of tuberculosis Katarina Niward, 2019-04-24 Each year around 10 million of individuals develop active tuberculosis TB Worldwide TB is the leading cause of death from an infectious agent surpassing both malaria and HIV Current treatment regimens are long and therefore encompass a risk of nonadherence and development of acquired drug resistance reflected in the increase of multidrug resistant MDR and extensively drug resistant XDR TB Indeed this calls for prudent use of existing TB drugs and improvement of TB treatment strategies The aim of this thesis was to investigate the current drug susceptibility testing DST breakpoints for *Mycobacterium tuberculosis* M tuberculosis the pharmacokinetics and pharmacodynamics PK PD of TB treatment and to explore the role of therapeutic drug monitoring TDM for optimising TB treatment Drug resistance in M tuberculosis is expressed over a continuous scale and for some drugs it may be identified as low and high level resistance This has been poorly reflected in currently used binary susceptibility breakpoints for TB drugs Results from genome sequencing and phenotypic DST of ofloxacin and levofloxacin were compared in study I and current breakpoints were found to misclassify up to 25% of M tuberculosis isolates with resistance mutations in *gyrA* as susceptible to fluoroquinolones This finding may have implications for the classification of XDR TB treatment of MDR TB and the evaluation of fluoroquinolones in clinical studies Study II was a prospective cohort study of susceptible TB in Sweden where drug concentrations of first line TB drugs were measured along with the susceptibility level of the bacteria defined by the minimum inhibitory concentration MIC of M tuberculosis First line drug concentrations below the reference range 16 42% were common and most pronounced for rifampicin 13 31 42% An exploratory investigation of PK PD parameters displayed a

wide distribution of ratios between drug exposures and MICs Rifampicin exhibited higher level of individual fluctuations over time during TB treatment compared with isoniazid In study III the plasma drug concentrations of rifampicin were compared to the tuberculosis drug activity assay TDA and results showed that rifampicin drug levels but not drug levels of the other first line drugs correlated with TDA Patients with rifampicin drug levels below 8 mg L had significantly lower median TDA This finding supports the use of TDA as a potential indicator for low rifampicin exposure in resource constrained settings without access to drug concentration analysis The study design in study II has been further developed in study IV which is a prospective cohort study of MDR TB in China where drug exposure will be explored in relation to individual bacterial MIC and measurements of treatment outcome In summary the work in this thesis emphasises the importance of reliable DST of M tuberculosis and the need to re evaluate the currently used breakpoints Therapeutic drug monitoring TDM based on drug concentrations and MICs is a useful tool to avoid suboptimal drug exposure and to individualise TB treatments Such strategies may improve treatment regimens and avoid further development of resistance

Tuberculosis of the Gastrointestinal system Vishal Sharma,2022-02-22 Tuberculosis is an important concern in numerous countries across the globe Training is usually focused on pulmonary tuberculosis and the nuances of diagnosis and management of extrapulmonary tuberculosis including abdominal tuberculosis are not usually emphasized This book details the varied presentations and mimics of tubercular involvement of the abdomen and the gastrointestinal system The book provides clear guidance to the clinicians to diagnosis and manage the varied forms of abdominal tuberculosis The chapters also touch on areas of controversy and confusion Chapters are focused on each of the sites intestinal peritoneal gastroduodenal hepatobiliary and pancreatic modalities for evaluation histology microbiology radiology endoscopic ultrasound nuclear medicine differential diagnosis and follow up including response to treatment Separate chapters have also been devoted to pediatric abdominal TB therapy related hepatitis and considerations in immunocompromised states such as HIV Therefore this book will help practice clinicians and serve as a one stop resource for graduate students in internal medicine and fellows training in gastroenterology
