Global Warming C. M. Wood, D. G. McDonald, 1997-05-13. Global warming and climate change are growing environmental concerns which are much in the scientific, governmental, and public eye. The potential impact on freshwater and marine fishes is immense because most fish have no physiological ability to regulate their body temperature. This volume focuses on the effects of temperature at all levels of organization in fish, with particular emphasis on physiological function, cells, epithelia, organ systems, the whole organism, reproduction, behaviour, pollutant interactions, ecology, and population dynamics, with each chapter written by experts in the field. Many chapters also speculate on the long-term physiological and ecological implications to fish of a 2-4 °C global warming scenario. Researchers and graduate students in the areas of animal physiology and behaviour, environmental toxicology, population ecology, and fisheries biology and management will find this volume of particular interest.
