Research of the origins of life in connection with a marine environment started at the end of the seventies when the black smokers in the Pacific were discovered and the Red Sea deep hydrothermal brines were found to be a fruitful environment for abiotic synthesis of life precursors. For a while this research was categorised under the heading chemistry but in less than a decade the topic became fully integrated into the science of oceanography. This volume contains the final report of this working group.

Where does the environment leave off and society begin? When expanding production and consumption drives greenhouse gas emissions that warm the planet, which in turn influence the conditions of economic expansion, it is unclear where the climate ends and the economy begins. This fact is not new to our era; however, our social and natural sciences have only recently come to grips with the incredible complexity of the world described by understanding the environment and society as being of a piece. As a result, in the last decade there has been an unprecedented explosion of new concepts, theories, facts and techniques that follow from such an understanding. The *Encyclopedia of Environment and Society* brings together multiplying issues, concepts, theories, examples, problems and policies with the goal of clearly explicating an emerging way of thinking about people and nature. With more than 1 200 entries written by experts from incredibly diverse fields, this innovative resource is a first step toward diving into the deep pool of emerging knowledge.
