During the voyage of the HMS *Beagle* (1831–1836), the young Charles Darwin collected several species of finches from the Galápagos Islands. Two of Darwin's finches are shown below.

Geospiza magnirostris

Geospiza fortis

Which species do you think is best adapted to a diet of small, delicate seeds? Explain why you think so.

Geospiza fortis because it has a smaller, pointed beak that can help pick up small, delicate seeds.

Which species do you think is best adapted to a diet of large, tough-to-crack seeds? Explain.

The Geospiza magnirostris would probably be better at eating large, tough-to-crack seeds because its beak would help it crush the shells up more easily.

Gizmo Warm-up

Darwin's finches are one of many types of animals on the Galápagos Islands that have unique **adaptations**, or traits that help an organism survive in its environment. The *Rainfall and Bird Beaks* Gizmo allows you to explore how rainfall influences the range of beak shapes found in a single finch species.

1. The **beak depth** of a finch is the distance from the top of the beak to the bottom, as shown.
 - A. What is the current average beak depth in the Gizmo? **10.16 mm**
 - B. Select the HISTOGRAM tab. Do all the finches have the same beak depth? **No, most are different.**
2. Click **Play** (▶) and let the simulation play for five years with average rainfall (25 cm/yr). Select the GRAPH tab and view the **Finches vs time** and **Beak depth vs time** graphs.
 - A. How does the finch population change? **The population has some variation and change because it goes up in numbers then it goes down slightly again and climbs back up again with a decline following.**
