Database Dreaming Volume I

C. J. Date, 2022-02-11 Along with its companion volume Database Dreaming Volume II this book offers a collection of essays on the general topic of relational databases and relational database technology Most of those essays though not all have been published before but only in journals and magazines that are now hard to find or in books that are now out of print Here's a lightly edited excerpt from the preface so this is the author speaking I went back and reviewed all of those early essays looking for ones that seemed worth reviving or

rather revising and reviving at this time Of course some of them definitely weren't However out of a total of around 130 original papers I did find some 20 or so that seemed to me worth preserving and hadn't already been incorporated in or superseded by more recent books of mine So I tracked down the original versions of those 20 or so papers and set to work When I was done though I found I had somewhere in excess of 600 pages on my hands too much in my view for just one book and so I split them across two separate volumes Highlights of the present volume include a discussion of the difficulties involved in providing a relational interface to a nonrelational system a tutorial on the quantifiers and what happens to them under three valued logic an examination of the effect of user defined types on optimization some thoughts on normalization and database design tools and caveats regarding certain important database operators especially outer join and negation

Mathematical Modeling and Optimization Tony Hürlimann,2013-03-14 Computer based mathematical modeling the technique of representing and managing models in machine readable form is still in its infancy despite the many powerful mathematical software packages already available which can solve astonishingly complex and large models On the one hand using mathematical and logical notation we can formulate models which cannot be solved by any computer in reasonable time or which cannot even be solved by any method On the other hand we can solve certain classes of much larger models than we can practically handle and manipulate without heavy programming This is especially true in operations research where it is common to solve models with many thousands of variables Even today there are no general modeling tools that accompany the whole modeling process from start to finish that is to say from model creation to report writing This book proposes a framework for computer based modeling More precisely it puts forward a modeling language as a kernel representation for mathematical models It presents a general specification for modeling tools The book does not expose any solution methods or algorithms which may be useful in solving models neither is it a treatise on how to build them No help is intended here for the modeler by giving practical modeling exercises although several models will be presented in order to illustrate the framework Nevertheless a short introduction to the modeling process is given in order to expound the necessary background for the proposed modeling framework **J2EE Applications and BEA WebLogic Server** Michael
