The "Broken" Plural Problem in Arabic and Comparative Semitic Robert R. Ratcliffe,1998-12-15 The formal aspects of non concatenative morphology have received considerable attention in recent years but the diachronic dimensions of such systems have been little explored The current work applies a modern methodological and theoretical framework to a classic problem in Arabic and Semitic historical linguistics the highly allomorphic system of stem internal or broken plurals It shows that widely accepted views regarding the historical development of this system are untenable and offers a new hypothesis The first chapter lays out a methodology for comparative historical research in morphology The next two chapters present an analysis of Arabic morphology based on contemporary formal linguistic approaches and applies this analysis to the noun plural system Chapter Four shows that neither semantic shift nor ablaut type sound change account adequately for the data The fifth chapter offers a systematic comparison of the plural systems of Semitic languages incorporating much new research on the languages of South Arabia and Ethiopia Chapter Six proposes a new reconstruction *20 Totally Awesome & Totally Easy Language Arts Bulletin Boards* Michael Gravois,2003 Boost language arts skills with this collection of decorativeand educationalclassroom displays These bulletin boards feature mostly student creations saving teachers time and giving kids a sense of pride in the classroom Students assemble Eye Spy Collages to help understand the difference between proper and common nouns create Ornament Books that focus on story elements make Pop Up Posters to show story settings and much much more For use with Grades 4 8 **Seeing, second edition** John P. Frisby,James V. Stone,2010-04-02 An accessible yet rigorous and generously illustrated exploration of the computational approach to the study of biological vision Seeing has puzzled scientists and philosophers for centuries and it continues to do so This new edition of a classic text offers an accessible but rigorous introduction to the computational approach to understanding biological visual systems The authors of Seeing taking as their premise David Marr s statement that to understand vision by studying only neurons is like trying to understand bird flight by studying only feathers make use of Marr s three different levels of analysis in the study of vision the computational level the algorithmic level and the hardware implementation level Each chapter applies this approach to a different topic in vision by examining the problems the visual system encounters in interpreting retinal images and the constraints available to solve these problems the algorithms that can realize the solution and the implementation of these algorithms in neurons Seeing has been thoroughly updated for this edition and expanded to more than three times its original length It is designed to lead the reader through the problems of vision from the common but mistaken idea that seeing consists just of making pictures in the brain to the minutiae of how neurons collectively encode the visual features that underpin seeing Although it assumes no prior knowledge of the field some chapters present advanced material This makes it the only textbook suitable for both undergraduate and graduate students that takes a consistently computational perspective offering a firm conceptual basis for tackling the vast literature on vision It covers a wide range of topics including aftereffects
