Project Valuation and Decision Making under Risk and Uncertainty applying Decision Tree Analysis and Monte Carlo Simulation Donald Dibra, 2015-04-28 This work presents the application of the Monte Carlo Simulation method and the Decision Tree Analysis approach when dealing with the economic valuation of projects which are subjected to risks and uncertainties The Net Present Value of a project is usually used as an investment decision parameter Using deterministic models to calculate a project's Net Present Value neglects the risky and uncertain nature of real life projects

and consequently leads to useless valuation results Realistic valuation models need to use probability density distributions for the input parameters and certain probabilities for the occurrence of specific events during the life time of a project in combination with the Monte Carlo Simulation method and the Decision Tree Analysis approach After a short introduction a brief explanation of the traditional project valuation methods is given The main focus of this work lies in using the Net Present Value method as a basic valuation tool in conjunction with the Monte Carlo Simulation technique and the Decision Tree Analysis approach to form a comprehensive method for project valuation under risk and uncertainty The extensive project valuation methodology introduced is applied on two fictional projects one from the pharmaceutical sector and one from the oil and gas exploration and production industry Both industries deal with high risks high uncertainties and high costs but also high rewards The example from the pharmaceutical industry illustrates very well how the application of the Monte Carlo Simulation and Decision Tree Analysis method results in a well diversified portfolio of new drugs with the highest reward at minimum possible risk Applying the presented probabilistic project valuation approach on the oil exploration and production project shows how to reduce the risk of losing big
