System Operations

During collision

- When either of the D-sensors and the S-sensor are activated (closed) simultaneously by the shock of a collision, the circuit to the inflator is completed. The inflator creates nitrogen gas and the air bags are deployed.
- The air bags release the nitrogen gas from a vent hole in the back of the bag to reduce shock to the driver and passenger and to allow easier exit from the vehicle.

During normal condition and malfunction

- The diagnostic module constantly monitors the components and wiring of the air bag system for malfunction, open circuits, and short circuits.
- If a malfunction is detected, the diagnostic module illuminates or flashes the warning light.
- If there is a short circuit in the sensors or sensor harnesses, the diagnostic module activates the warning light and shuts down the system to prevent accidental deployment of the air bags.
