Classification of Image Spam Shruti Wakade, 2011 Image spam is one of the most prevalent forms of spam ever since its inception Spammers have refined their spamming techniques to use smaller more colorful and photo quality images as spam In spite of numerous efforts to build efficient spam filters against e mail spam by researchers and free mailing services like yahoo mail Gmail etc spam filters still fail to arrest image spam This research is an attempt to understand the techniques used in spamming and identifying a set of features that can help in classification of image spam from photographs A set of eight features were identified based on observations and existing research in this area Among the eight features six features have been

introduced by us and two other features have been included from previous research Data mining techniques were then applied to classify image spam from photographs Identifying a set of efficient yet computationally inexpensive features was the objective that guided this research work We achieved classification accuracy of 89% for the test samples A detailed trail of image spam has been studied to identify the most prevalent types and patterns in image spam Our results indicate that five of the six features we had introduced proved to be of high significance in identifying image spam from photographs

Image Spam Filtering Through Multi-features Analysis Zubaidah Muataz Hazza Al Hazza,2015 Email spam has been an ongoing internet security attack It has matured in different forms of attack such as text based spam URL based spam and image based spam By making use of image spam spammers managed to bypass the defence system of most anti spam solutions Here the images display text messages to the end users but the anti spam software only sees pixels and cannot differentiate the text Presently image classification offers effective way to filter image spam It requires extracting and analyzing selected features in the image In this thesis a lightweight image spam filter is proposed and implemented It uses text colour URL and header features Selecting simple and effective methods for each feature has been worked out to reduce the computing cost and enable a lightweight anti image spam solution One main feature being used is detecting the text components in the image which is challenging due to the application of obfuscation methods by spammers Major contributions of this thesis are research and implementation of i text detection method for obfuscated text named Accumulated Text Extraction ATE and ii colour analysis method named Saturation Lightness classification SLC for differentiating between computer generated and natural images and iii image spam filter named Lightweight Image Spam Filter LISF that uses lightweight methods to extract features The proposed image spam filter consists of four phases text analyzer colour analyzer URL analyzer and header analyzer The proposed methods give high detection rates compared to other methods ATE gives F measure value of 86% SLC gives F measure value of 85% and LISF gives F measure value of 88% for detecting image spam The results indicated that the proposed methods for text and colour features are effective and can be applied for image spam filtering

Using Artificial Neural Networks to Identify Image Spam Priscilla Hope,2008 Internet technology has made international communication easy and convenient This convenience has compelled a number of people to rely on electronic mail for almost all spheres of life personal business etc Scrupulous organizations individuals have taken undue advantage of this convenience and populate users inboxes with unwanted messages making email spam a menace Even as anti spam software producers think they have almost solved the problem spammers come out with new techniques One such tactic in the spammers toolbox comes in the form of image spam messages that contain little more than a link to an image rendered in an HTML mail reader The image typically contains the spam message one hopes to avoid yet it is able to bypass most filters due to the composition and format of these pictures This research focuses on identifying these images as spam by using an artificial neural network ANN software programs used for recognizing patterns based on the

biological neural networks in our brains As information propagates through a neural network it learns about the data A large collection of both spam and non spam images have being used to train an ANN and then test the effectiveness of the trained network against an unidentified or already identified set of pictures This process involves formatting images and adding the desired training values expected by the ANN Several different ANNS have being trained using different configurations of hidden layers and nodes per layer A detailed process for preprocessing spam image files is given followed by a description on how to train an artificial neural network to distinguish between ham and spam Finally the trained network is tested against both known and unknown images
