

Solar System Study Guide

Our solar system includes planets with unique characteristics, mainly due to their locations in the solar system. Earth is unique because its location and characteristics allow life to exist. The relationship of the Earth, moon, and sun lead to seasons, tides, and the phases of the moon.

Our Solar System:

We live in an ancient solar system that includes the sun, planets, dwarf planets, moons, dust, gas, and other objects like comets and asteroids. This solar system is one of many that are located in the Milky Way galaxy.

Early astronomers thought that Earth was the center of the universe and that all other heavenly bodies moved around it. Today, we know that the sun is the center of the solar system and that the planets move around it.

The Planets:

Our solar system has eight planets: Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. They revolve, or move in oval-shaped paths (called orbits), around the sun.

The order of the planets according to their position from the sun (closest to farthest) is:
Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, Neptune.

Mnemonic device: **"My Very Educated Mother Just Served Us Noodles"**

The order of the planets according to their sizes (largest to smallest) is:

Jupiter, Saturn, Uranus, Neptune, Earth, Venus, Mars, Mercury.

Mnemonic device: **"Jason Sat Under Ninety-Eight Very Marvelous Monsters"**

Pluto used to be classified as the ninth planet from the sun. It's no longer included in the list of planets due to its small size and irregular orbit. Pluto is now considered a **dwarf planet**.
