The Solar System

The solar system was formed approximately 4.6 billion years ago by the collapse of a giant molecular cloud. The mass at its center collected to form the Sun and a flat disk of dust around it. This eventually formed the planets and other bodies of the solar system. Eight planets orbit or revolve around, the sun. The planets and the sun are parts of our solar system. The sun is a star. It is a giant ball of hot gas. Mercury is the closest planet to the sun. It has mountains, cliffs, and plains. Venus is the hottest planet. It can reach up to 850 degrees. That is hot enough to melt a rocket ship! Earth is our home. It is the only planet that has the oxygen and water that people, animals, and plants need to live. Mars is a cold planet. It is sometimes called the Red Planet because it has reddish soil. Jupiter is the largest planet. It is made of thick gases. If you tried to land a rocket ship, you would sink into the planet! Saturn is the second-largest planet. Like Jupiter, it is made mostly of gases. Its rings are made up of rock, ice, and dust. Uranus is cold and windy. It was the first planet to be discovered with a telescope, in 1781. Neptune is called the Blue Planet. It is the coldest planet because it is farthest from the sun. Jupiter, Saturn, Uranus, and Neptune are gas planets. They all have rings. Only Saturn's rings are thick enough to be seen easily from Earth. 99.86% of the solar system's mass is found in the Sun. The majority of the remaining 0.14% is contained within the eight planets.
