

Membrane Function

How does the cell membrane control movement of materials?

Why?

The membrane is critical to the maintenance of homeostasis in living organisms. The cell membrane separates the cell from the external environment and plays a critical role in regulating movement of material in and out of the cell. Additionally, eukaryotic cells are made complex by the presence of internal membranes that form organelles, so the cells may become specialized. These organelle membranes create compartments within the cell that can do specific functions.

Model 1 – Types of Ions and Molecules in a Cell

Type 1 Ions	Type 2 Molecules	Type 3 Molecules	Type 4 Molecules
Potassium: K^+	Glucose: 	Water:  Urea: 	Molecular oxygen (O_2): $O=O$ Carbon dioxide (CO_2): $O=C=O$
Sodium: Na^+			
Calcium: Ca^{2+}			
Chloride: Cl^-			
Polar	polar	Polar	nonpolar
small	large	small	small

- Consider the ions and molecules in Model 1.
 - Identify at least two substances that would need to move into a cell to maintain homeostasis.

The two substances that would need to move into a cell to maintain homeostasis are.. Oxygen, water, sugar, and ions.

- Briefly explain why the cell needs each of the substances you identified in part a.

Oxygen, water, and glucose are necessary for cellular respiration; and ions for energy.

- Consider the ions and molecules in Model 1.
 - Identify at least two substances that would need to move out of a cell to maintain homeostasis.

Carbon dioxide, water, ions, and urea would need to come out of the cell.

- Briefly explain the source of the molecules you identified in part a.

Water and carbon dioxide are a byproduct of cellular respiration

- Complete the table by labeling the types of substances as polar or nonpolar and large or small.

Cell Boundaries John Stephen White, Stephen H. White, Gunnar von Heijne, Donald M. Engelman, 2021-12-31 The central themes of Cell Boundaries concern the structural and organizational principles underlying cell membranes and how these principles enable function By building a biological and biophysical foundation for understanding the organization of lipids in bilayers and the folding assembly stability and function of membrane proteins the book aims to broaden the knowledge of bioscience students to include the basic physics and physical chemistry that inform us about membranes In doing so it is hoped that physics students will find familiar territory that will lead them to an interest in biology Our progress toward understanding membranes and membrane proteins depends strongly upon the concerted use of both biology and physics It is important for students to know not only what we know but how we have come to know it so Cell Boundaries endeavours to bring out the history behind the central discoveries especially in the early chapters where the foundation is laid for later chapters Science is far more interesting if as students we can appreciate and share in the adventures and misadventures of discovering new scientific knowledge Cell Boundaries was written with advanced undergraduates and beginning graduate students in the biological and physical sciences in mind though this textbook will likely have appeal to researchers and other academics as well Highlights the history of important central discoveries Early chapters lay the foundation for later chapters to build on so knowledge is amassed High quality line diagrams illustrate key concepts and illuminate molecular mechanisms Box features and spreads expand on topics in main text including histories of discoveries special techniques and applications
