1. The product of the reaction above is called a "dipeptide".
  - a. Which two functional groups are involved in this reaction? Circle and label these two groups on the reactants. **Carboxyl and amino group**
  - b. Circle and label the new **peptide bond** formed between the two amino acids.
  - c. Does a peptide bond involve the amino acid "**backbone**" or **R-groups**? (Circle one.)
  - d. Draw a square around each **amino acid** in the dipeptide. An amino acid that is part of a polypeptide chain is referred to as a "**residue**."
  - e. Label the "**N-terminus**" and the "**C-terminus**" (also known as the amino- and carboxy-termini) of the dipeptide molecule. ("terminus"="end")
2. The addition (**polymerization**) of amino acid **monomers** is directional, with new amino acids added only onto the C-terminus of the growing polypeptide chain.

- b. Circle the **peptide bonds** and label the "**N-terminus**" and the "**C-terminus**" of your tripeptide.
- c. Assign each term: **charged**, **nonpolar**, and **polar** to the correct R-group in your tripeptide.
- d. Two of your R-groups are **hydrophilic** and can form **hydrogen bonds** with water. Draw two H<sub>2</sub>O molecules interacting with your tripeptide, using dotted lines to represent the hydrogen bonds. Label the partial charges of the atoms involved in each hydrogen bond you draw.

**Architecture** Nobuhiko Saito, Yukio Kobayashi, 2001 A protein requires its own three dimensional structure for its biological activity If a chemical agent is added the biological activity is lost and the three dimensional structure is destroyed to become a random coil state But when the chemical agent is removed the biological activity is recovered implying that the random coil state turns back into the original complex structure spontaneously This is an astonishing event The Physical Foundation of Protein Architecture is intended to solve this mystery from the physicochemical basis by elucidating the mechanism of various processes in protein folding The main features of protein folding are shown to be described by the island model with long range hydrophobic interaction which is capable of finding the specific residue and the lampshade criterion for disulfide bonding Various proteins with known structure are refolded with the purpose of uncovering the mechanism of protein folding In addition ab initio method for predicting protein structure from its amino acid sequence is proposed      *Protein Structure*
