

Calorimetry

What is calorimetry? How does it measure heat energy and temperature?

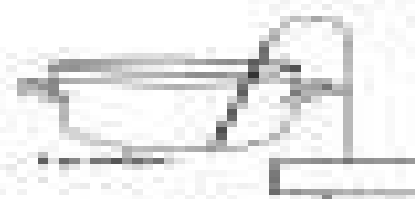

When a substance is heated, the temperature of that substance increases. Will the temperature of every other different substance be heated identical temperature increase? Will the same amount of energy be added to a same substance temperature increase in different amounts of the same substance? In this practice you will explore how mass, temperature, heat energy, and the type of substance are related.

Model 1 – A Plot of Mass

Calorimetry

How long did it take to heat 100g of water per minute?

1. In Model 1, which substance had the same amount of heat? 100g

2. Compare the graphs/curves in Model 1.

a. How many total joules of energy were added to the temperature? 100 Joules

b. How many total joules of energy were added to the temperature? 200 Joules

c. In Model 1, which substance had the highest mass? Which substance had the lowest mass? Which substance had the highest temperature? Which substance had the lowest temperature?

What is the relationship between mass, temperature, and heat energy? Heat energy is proportional to mass and temperature. The more mass, the more heat energy is needed to raise the temperature. The more temperature, the more heat energy is needed to raise the temperature.

Calorimetry Wolfgang Hemminger, 1984 Calorimetry American Meter Company, 1917 **Theory of Calorimetry** W. Zielenkiewicz, E. Margas, 2006-01-02 Calorimetry is one of the oldest areas of physical chemistry The date on which calorimetry came into being may be taken as 13 June 1783 the day on which Lavoisier and Laplace presented a contribution entitled Memoire de la Chaleur at a session of the Academie Fran aise Throughout the existence of calorimetry many new methods have been developed and the measuring techniques have been improved At p sent numerous laboratories worldwide continue to focus attention on the development and applications of calorimetry and a number of com nies specialize in the production of calorimeters The calorimeter is an instrument that allows heat effects in it to be determined by directly measurement of temperature Accordingly to determine a heat effect it is necessary to establish the relationship tween the heat effect generated and the quantity measured in the ca rimeter It is this relationship that unambiguously determines the mathematical model of the calorimeter Depending on the type of ca rimeter applied the accuracy required and the conditions of heat and mass transfer that prevail in the device the relationship between the measured and generated quantities can assume different mathematical forms Calorimetry ...
