

Activity 4.2.2 Calorimetry POGIL[®]

What is the relationship between heat energy and temperature?

Purpose: Students actively gain understanding of how mass, temperature, and heat energy, which is proportional to ΔT , are related.

Model 1 – A Hot oil Bath
(Silver Bulb)

Model 2 – A Hot oil Bath
(A smaller oil bath per mass)

Consider the graphs specified in Model 1:

1. Suppose substance A and substance B gain some energy, or that both gain the same amount. Explain your reasoning.

2. How can substance A be heated without the temperature increasing or decreasing? Explain your reasoning.

Zielenkiewicz, E. Margas, 2006-01-02 Calorimetry is one of the oldest areas of physical chemistry The date on which calorimetry came into being may be taken as 13 June 1783 the day on which Lavoisier and Laplace presented a contribution entitled Memoire de la Chaleur at a session of the Academie Fran aise Throughout the existence of calorimetry many new methods have been developed and the measuring techniques have been improved At present numerous laboratories worldwide continue to focus attention on the development and applications of calorimetry and a number of companies specialize in the production of calorimeters The calorimeter is an instrument that allows heat effects in it to be determined by direct measurement of temperature Accordingly to determine a heat effect it is necessary to establish the relationship between the heat effect generated and the quantity measured in the calorimeter It is this relationship that unambiguously determines the mathematical model of the calorimeter Depending on the type of calorimeter applied the accuracy required and the conditions of heat and mass transfer that prevail in the device the relationship between the measured and generated quantities can assume different mathematical forms *The Nature of Heat: Heat and temperature* R. Calorimetry as a technique for thermal analysis has a wide range of applications which are not only limited to studying the thermal characterisation e g melting temperature denaturation temperature and enthalpy change of small and large drug molecules but are also extended to characterisation of fuel metals and oils Differential Scanning Calorimetry is used to study the thermal behaviours of drug molecules and excipients by measuring the differential heat flow needed to maintain the temperature difference between the sample and reference cells equal to zero upon heating at a controlled programmed rate Microcalorimetry is used to study the thermal transition and folding of biological macromolecules in dilute solutions Microcalorimetry is applied in formulation and stabilisation of therapeutic proteins This book presents research from all over the world on the applications of calorimetry on both solid and liquid states of materials **Heat & Energy** David Randall Pye,1923 Longitudinal Heat Flow Calorimetry A. Antriasian,G. Beardsmore,2014 We present a method for measuring the heat capacity of a rock specimen using a divided bar apparatus in a transient mode The specific heat capacity can be derived if the mass of the specimen is known Thermal conductivity can be measured during a steady state phase of the measurement process and longitudinal thermal diffusivity can also be derived if the specimen volume and hence density is measured A divided bar delivers a longitudinal flow of heat through a rock specimen and is conventionally used only in a steady state mode for thermal conductivity measurements Our method employs a time series record of temperature changes at four points along the divided bar assembly to compare the net thermal energy absorbed by a specimen to its change in temperature during thermal re equilibration from one steady state temperature to another The technique is calibrated using a set of analytical standards of known heat capacity Our method yields mean values of specific heat capacity within 1 % of published values for cultured quartz Repeated measurements on the same specimens also give consistent results within approximately 1 % A combined thermal conductivity and heat capacity measurement takes less than one hour per specimen Our method can be replicated with any divided bar apparatus employing a precise electronic temperature control system capable of switching between two steady state mean temperatures along with a digital data logging system capable of recording and displaying data at a rate of one record per second Analytical Calorimetry Roger S. Porter,Julian F. Johnson,2013-11-21 The research reported in the third volume of Analytical Calorimetry covers a wide variety of topics The variety indicates the sophistication which thermal analysis is reaching and addition ally the ever widening applications that are being developed Advances in instrumentation include microcalorimeter design development and refinement of titration calorimetry definition of further theory of scanning calorimetry studies of the temperature of resolution of thermistors and a refinement of the effluent gas analysis technique and its application to agricultural chemicals as well as organic materials A

Calorimetry of Non-Reacting Systems John P. McCullough,Donald W. Scott,2013-10-22 Experimental Thermodynamics Volume 1 Calorimetry of Non Reacting Systems covers the heat capacity determinations for chemical substances in the solid liquid solution and vapor states at temperatures ranging from near the absolute zero to the highest at which calorimetry is feasible This book is divided into 14 chapters The first four chapters provide background information and general principles applicable to all types of calorimetry of non reacting systems The remaining 10 chapters deal with specific types of calorimetry Most of the types of calorimetry treated are developed over a considerable period and brought to a relatively sophisticated state For such calorimetry the approach adopted is to give detailed accounts of a few examples of apparatus and techniques representative of the best current practice in the field For the few types of calorimetry a general review of the field was considered more appropriate This book will prove useful to thermochemists engineers and experimentalists Calorimetry in Food Processing Gönül Kaletunç,2009-08-06 Calorimetry in Food Processing Analysis and

Design of Food Systems introduces the basic principles of calorimetry and highlights various applications of calorimetry to characterize temperature induced changes including starch gelatinization and crystallization lipid transitions protein denaturation and inactivation of microorganisms in a variety of food and biological materials Emphasis is given to the use of calorimetry as a tool for evaluation of processing requirements in order to assess the efficacy of food processing and for characterization of the effects of changes in formulation and processing conditions

Animal and Human Calorimetry J. A. McLean, G. Tobin, 1987 This volume provides a comprehensive survey of the theory practice and techniques of calorimetry as applied to the study of energy metabolism in humans and animals Calorimetry is used to estimate nutritional requirements of man and farm livestock and to evaluate different foods It is also a powerful tool used in research into fundamental nutritional and physiological life processes and in the evaluation of stresses imposed by abnormal or severe environments It is currently being applied in various branches of medical research and can be used as a diagnostic tool in hospitals for investigation of metabolic disorders The authors discuss both direct calorimetry which measures heat loss directly and indirect calorimetry where heat loss is inferred by measurement of some of the chemical byproducts of metabolism In addition guidance is provided to the instrumentation technical problems and precautions necessary to obtain accurate calorimetric measurements
