Biological and Genetic Basis of Agronomical and Seed Quality Traits in Legumes Jose C. Jimenez-Lopez, Alfonso Clemente, Sergio J. Ochatt, Maria Carlota Vaz Patto, Eric Von Wettberg, Petr Smýkal, 2022-11-10 **Genomic Selection:**

Lessons Learned and Perspectives Johannes W. R. Martini, Sarah J. Hearne, Brian Gardunia, Valentin Wimmer, Fernando H. Toledo, 2022-09-15

Genomic selection GS has been the most prominent topic in breeding science in the last two decades The continued interest is promoted by its huge potential impact on the efficiency of breeding Predicting a breeding value based on molecular markers and phenotypic values of relatives may be used to manipulate three parameters of the breeder's equation First the accuracy of the selection may be improved by predicting the genetic value more reliably when considering the records of relatives and the realized genomic relationship Secondly genotyping and predicting may be more cost effective than comprehensive phenotyping Resources can instead be allocated to increasing population sizes and selection intensity The third probably most important factor is time As shown in dairy cattle breeding reducing cycle time by crossing selection candidates earlier may have the strongest impact on selection gain Many different prediction models have been used and different ways of using predicted values in a breeding program have been explored We would like to address the questions i How did GS change breeding schemes of different crops in the last 20 years ii What was the impact on realized selection gain iii What would be the best structure of a crop specific breeding scheme to exploit the full potential of GS iv What is the potential of hybrid prediction epistasis effect models deep learning methods and other extensions of the standard prediction of additive effects v What are the long term effects of GS vi Can predictive breeding approaches also be used to harness genetic resources from germplasm banks in a more efficient way to adapt current germplasm to new environmental challenges This Research Topic welcomes submissions of Original Research papers Opinions Perspectives Reviews and Mini Reviews related to these themes 1 Genomic selection statistical methodology 2 The optimal use of GS in breeding schemes 3 Practical experiences with GS selection gain long term effects negative side effects 4 Predictive approaches to harness genetic resources Concerning point 1 If an original research paper compares different methods empirically without theoretical considerations on when one or the other method should be better the methods should be compared with at least five different data sets The data sets should differ either in crop genotyping method or its source for instance from a breeding program or gene bank accessions Concerning point 2 Manuscripts addressing the use of GS in breeding schemes should illustrate breeding schemes that are run in practice General ideas about schemes that may be run in the future may be considered as Perspective articles Conflict of Interest statements Topic Editor Valentin Wimmer is affiliated to KWS SAAT SE Co KGaA Germany Topic Editor Brian Gardunia is affiliated to Bayer Crop Sciences and has a collaboration with AbacusBio and is an author on patents with Bayer Crop Sciences The other Topic Editors did not disclose any conflicts of interest Image credit CIMMYT reproduced under the CC BY NC SA 2.0 license *Plant Genetics and Molecular Breeding*

Pedro Martínez-Gómez,2019-07-11 The development of new plant varieties is a long and tedious process involving the generation of large seedling populations for the selection of the best individuals While the ability of breeders to generate large populations is almost unlimited the selection of these seedlings is the main factor limiting the generation of new cultivars Molecular studies for the development of marker assisted selection MAS strategies are particularly useful when the evaluation of the character is expensive time consuming or with long juvenile periods The papers published in the Special Issue Plant Genetics and Molecular Breeding report highly novel results and testable new models for the integrative analysis of genetic phenotyping and transmission of agronomic characters physiology flowering ripening organ development genomic DNA regions responsible for the different agronomic characters transcriptomic gene expression analysis of the characters proteomic proteins and enzymes involved in the expression of the characters metabolomic secondary metabolites and epigenetic DNA methylation and histone modifications approaches for the development of new MAS strategies These molecular approaches together with an increasingly accurate phenotyping will facilitate the breeding of new climate resilient varieties resistant to abiotic and biotic stress with suitable productivity and quality to extend the adaptation and viability of the current varieties **The Brassicaceae – Agri-Horticultural and Environmental Perspectives** Naser A.

crops: Physiological and biochemical approaches Arpna Kumari,Milan Skalicky,Hirofumi Saneoka,Ibrahim Al-Ashkar,2024-08-20 Changes in natural ecosystems can affect biodiversity on a global scale which in turn affects global food production Climate change develops under different environmental conditions such as high CO₂ concentration ultraviolet radiation temperature salinity rainfall intensity etc causing an increase in the growth of new weeds and pathogens All these factors alone and in complex can reduce growth complicate photosynthesis and reduce the physiological and

biochemical responses of plants On the other hand studies in recent years have shown that the development of a dual strategy of breeding for stress tolerance and introducing stress tolerant plants into production systems to increase their resistance to various stresses is particularly relevant today Therefore research related to physiological biochemical and molecular responses of plants is of paramount importance to authorize the effects of climate induced stresses and the likely mechanisms of resistance and or factors mitigating these stresses in crop plants Climate change is a dynamic multifaceted system of modifications to environmental conditions that include abiotic and biotic factors in the world Therefore rapid development of studies on the integration between physiological biochemical and molecular responses that can admit a systems analysis of plants is important and knowledge of molecular mechanisms will provide breeding programs with relevance to obtaining cultivars tolerant to abiotic stresses with increased productivity Under this research topic reviews new methods and scientific articles will be selected for publication based on applications to agriculture under climate change This research topic will cover the following themes Adaptive capacity of plants to withstand climate change The role of biodiversity in sustainable agriculture Manipulation of microclimate for plant productivity Role of plant extracts in plant stress mitigation Phytoremediation and bioremediation factors for crop improvement Perspective of underutilized crops under climate change Contribution of plant secondary metabolism to stress tolerance Plant tissue culture and crop improvement The role of nanotechnology for climate resilient agriculture Pre breeding and germplasm characterization for the development of agronomically relevant crop traits
