POGIL-The Mole Concept (How can atoms be counted?)

Why?

Consider the following equation for a chemical reaction: $2\text{H}_2 + \text{O}_2 \rightarrow 2\text{H}_2\text{O}$

This can be interpreted as two molecules of hydrogen and one molecule of oxygen combining to form two water molecules. But how often do chemists limit their reactions to one or two molecules? Usually a reaction is done with an unimaginable number of molecules. How then do chemists know they have the right mix? The molecules need to be quickly counted! How do we count molecules? The answer is the unit called the **mole**. Weighing is often easier than counting!

Model 1: The Balanced Equation

How can the coefficients in a chemical equation be interpreted?

Consider the reaction:

Key Questions

1. What are the coefficients for each of the following substances in the reaction?

Read This!

Coefficients tell you the relative amounts of products and reactants. A balanced chemical equation can be interpreted in terms of different quantities, including:

- Numbers of particles (atoms, molecules, or formula units)

PARTICLES

Atoms

(if you have a single element)

- Mass
- Volume
- **Moles**

Molecules

(if you have a covalent compound)

Formula Units

(if you have an ionic compound)

Exploring the Effectiveness of POGIL and Chemorganisers in Foundation Chemistry Christine Elizabeth Mundy, 2015 The extended BSc programme at the University of Pretoria was the context of this study specifically students enrolled in foundation chemistry This study was aimed at improving teaching and learning at this level by implementing pre-existing education interventions Process Oriented Guided Inquiry Learning POGIL and the use of the Chemorganiser Themes chosen for the interventions were the mole concept and stoichiometry and redox reactions as these have been identified as common areas of difficulty in Chemistry Johnston 2010 POGIL required students to take on well-defined roles and work in groups on specially designed worksheets Farrell Moog 1990 served as the theoretical lens for the study The effectiveness of each intervention was explored using the classroom variables of productivity student preference and opportunity to learn along with the output of student performance Mixed methods including observations focus group interviews student questionnaires and student performance data were used During the first year of implementation the Chemorganisers were well received by students Increased classroom participation and confidence was noted along with stable levels of attendance Students requested the inclusion of more challenging content This intervention did not affect the time allocated for the tutorials and

was easy to implement Students performed better on average than their counterparts a highly statistically significant difference was noted p
