

Membrane Function

How does the cell membrane control movement of materials?

Why?

The membrane is critical to the maintenance of homeostasis in living organisms. The cell membrane separates the cell from the external environment and plays a critical role in regulating movement of material in and out of the cell. Additionally, eukaryotic cells are made complex by the presence of internal membranes that form organelles, so the cells may become specialized. These organelle membranes create compartments within the cell that can do specific functions.

Model 1 – Types of Ions and Molecules in a Cell

Type 1 Ions	Type 2 Molecules	Type 3 Molecules	Type 4 Molecules
Potassium: K^+	Glucose: 	Water:  Urea: 	Molecular oxygen (O_2):  Carbon dioxide (CO_2): 
Sodium: Na^+			
Calcium: Ca^{2+}			
Chloride: Cl^-			
Polar	polar	Polar	nonpolar
small	large	Small	Small

- Consider the ions and molecules in Model 1.
 - Identify at least two substances that would need to move into a cell to maintain homeostasis.
Cells need water and oxygen to maintain homeostasis.
 - Briefly explain why the cell needs each of the substances you identified in part a.
Oxygen is needed to help create ATP for energy for cells, where as water is used to break things down and cause reactions like protein synthesis within cells.
- Consider the ions and molecules in Model 1.
 - Identify at least two substances that would need to move out of a cell to maintain homeostasis.
Glucose and Carbon Dioxide (CO_2).
 - Briefly explain the source of the molecules you identified in part a.
Glucose is needed around the cells to help stimulate energy, and carbon dioxide is used to help breakdown oxygen for plant cells to use.
- Complete the table by labeling the types of substances as polar or nonpolar and large or small.

Edward Bittar,1980 Elucidating the Roles of Membrane Microdomains in Cellular Resilience Melody Nazarbegian,2020 Plasma membrane compartments known as functional microdomains such as membrane lipid rafts MLRs and caveolae are critical in maintaining membrane structure and function which ultimately influences cellular survival Numerous studies demonstrate that membrane microdomains are necessary for vital cellular functions like intracellular transport and cell signaling but it remains unclear how plasma membrane organization is determined how membrane microdomains regulate membrane repair and how they work with intracellular organelles to enhance function To define the role of membrane microdomains in facilitating cellular resilience we focus on three specific areas 1 circadian control of membrane dynamics 2 membrane microdomain regulation of membrane repair and 3 membrane microdomain regulation of intracellular function Our findings suggest that membrane structural dynamics follow a daily oscillatory pattern and that membrane composition and organization may be partially determined by Bmal1 dependent clock genes Moreover we found that over expression of caveolin a structural protein critical to caveolae enhances the efficiency of membrane repair Lastly

we expect that over expression of caveolin will improve mitochondrial function in upcoming studies These studies suggest that caveolae improve cellular resilience by enhancing membrane durability and organelle function Thus these studies establish a holistic understanding of the plasma membrane and its microdomains laying the groundwork for further research on oscillatory rhythms at the membrane level quantification and enhancement of membrane repair kinetics and optimization of mitochondrial and membrane function via manipulations of membrane composition *Cell Membranes and Ion Transport*
