Recursive Partitioning in the Health Sciences Heping Zhang, Burton H. Singer, 2013-03-14 Multiple complex pathways characterized by interrelated events and conditions represent routes to many illnesses diseases and ultimately death Although there are substantial data and plausibility arguments supporting many conditions as contributory components of pathways to illness and disease end points we have historically lacked an effective methodology for identifying the structure of the full pathways Regression methods with strong linearity assumptions and data based constraints on the extent and order of interaction terms have traditionally been the strategies of choice for relating outcomes to potentially complex explanatory pathways However nonlinear relationships among candidate explanatory variables are a generic feature that must be dealt with in any characterization of how health outcomes come about Thus the purpose of this book is to demonstrate the effectiveness of a relatively recently developed methodology recursive partitioning as a response to this challenge We also compare and contrast what is learned via recursive partitioning with results obtained on the same data sets using more traditional methods This serves to highlight exactly where and for what kinds of questions recursive partitioning based strategies have a decisive advantage over classical regression techniques This book is suitable for three broad groups of readers 1 biomedical researchers clinicians public health practitioners including epidemiologists health service researchers environmental policy advisers 2 consulting statisticians who can use the recursive partitioning technique as a guide in providing effective and insightful solutions to clients problems and 3 statisticians interested in methodological and theoretical issues
