Security and risk management leaders evaluating VA products and services need to understand the important role they play in risk-based vulnerability management. VA identifies and assesses vulnerabilities proactively to establish the security and risk posture, not just to meet compliance mandates.

Overview

Key Findings

- Vulnerability assessment buyers are shifting from tools that only identify vulnerabilities, to those that proactively assess and manage the risks posed by those weaknesses. This is primarily being addressed by new vendors offering vendor-agnostic products, prompting companies offering solutions to update their offerings.
- The three VA solutions that dominate the market (Qualys, Tenable and Rapid7) are most often shortlisted by Gartner clients.
- Vendors in adjacent markets, such as endpoint detection and response, security information and event management, IT systems, and configuration management, are adding VA capabilities.
- The assessment of standard IT assets across a network is universally supported by VA vendors. Support for less-common technologies — such as containers, operational technology/supervisory control and data acquisition, cloud services, and mobile — varies widely.

Recommendations

Security and risk management leaders responsible for security operations and vulnerability management who are selecting and operating these solutions should:

- Evaluate VA solutions' capabilities for aiding in the prioritization of vulnerabilities and how the assessment phase is performed, so they can be more-efficiently managed in the organization.
- Assess the workflow, enterprise management and third-party technology integrations VA
