

Breast Cancer Research Paper

Breast cancer is a cancer that affects mainly women and can be very dangerous. There are many ways that breast cancer can affect the body at a cellular, tissue and organ level. Breast cancer can lead to altered functions within the body. There are multiple clinical manifestations of breast cancer and many signs to be observed and measured. There are many ways to test and treat breast cancer and also many complications of it. Breast cancer has many factors to it and has been researched for many years in hopes of finding a cure.

Etiology

According to the NIH, breast cancer occurs when there is a buildup of mutations in critical genes. Critical genes are those who control division, the growth of cells and fix damaged DNA. This buildup allows cells to divide and grow in an uncontrollable manor to form a tumor. Breast cancer is caused by genetic changes that commonly occur over a person's lifetime and are only in certain cells of the breast (NIH, 2019). The NIH also states that the genetic changes that take place are somatic mutations and not inherited. Many somatic mutations have been found in breast cancer cells. Some people possess gene mutations that increase the chance of getting breast cancer. There are also genetic changes that take place that are germ line mutations. This means that they are usually inherited and can cause someone to have a higher risk of getting breast cancer (NIH, 2019).

According to the CDC, in a lot of families, the genetic changes that occur and are associated with hereditary breast cancer are not known. There is active medical research going on that's goal is to identify additional genetic risk factors for breast cancer (CDC, 2018). There has been a lot of research done on breast cancer and researches are actively searching for more information, cures and treatments. The CDC also states that researchers have discovered
