

PHOTOLYSE STEMS AND LEAVES

Plants have structures that allow them to absorb light energy and convert it into glucose and oxygen.

Light energy from the sun is used to make glucose.

This is done in a process called photosynthesis.

- The light energy is captured by chlorophyll in the leaves.
- The chlorophyll uses the light energy to split water molecules.
- The oxygen is released into the atmosphere.

Plants have two main types of leaves: broad and needle.

Broad leaves are found in deciduous trees and are large, flat, and green. They have a large surface area to capture light energy.

Needle leaves are found in coniferous trees and are small, thin, and green. They have a small surface area to capture light energy.
