Constituent and Pattern in Poetry Archibald A. Hill, 2014-07-03 *Constituent and Pattern in Poetry* is a collection of essays on literature and language It is built on the assumption that works of literature have existence in the real world and that they may be analyzed in a fashion that is not totally subjective Using models derived from structural linguistics Archibald A Hill presents a number of theoretical contributions to the study of poetry as well as new ways of looking at specific poems The book as a whole provides an overview of the tools and ideas Hill has developed for analyzing works of literature and it is the first time the essays have been gathered together in one volume The book is divided into three sections Definition of Literature and Study of Its Patterns Types of Meaning and Imagery and Principles for Interpreting Meaning Each section opens with a theoretical essay followed by three essays that work analytically with specific poets and poems using the methods defined in the first In his examination of such poets as Hopkins Browning Milton Blake Keats and Dickinson Hill uses such proposals as the law of least lexical contribution and maximal contextual contribution the hypothesis that when possible meanings occur together in a cluster they support each other and the idea that it is sometimes possible to recover underlying language sequences from which the author has departed for

identifiable reasons By applying these suppositions to the study of particular poems Hill shows how the reader may arrive at statements about the relative artistic merit of works of literature

FORMAT II J. E. Serpanos,1967 A detailed description of the analytical approach development and use of a computer program which generates the matrices necessary for the analysis of general aircraft structures for deflections and stresses by the displacement method is presented The Displacement Method Matrix Generator program is designed for use in conjunction with the FORMAT II system as a user coded subroutine and as such will accommodate matrices of the order 2000 X 2000 Up to six degrees of freedom may be considered at each joint in the structure which is idealized as an assemblage of bar elements capable of resisting axial bending and torsional forces and triangular and rectangular panel elements capable of resisting membrane forces Applied loading may be any combination of mechanical loads at the joints thermal loads resulting from bar element elongation due to temperature change and initial joint displacements The report includes details associated with the treatment of oblique reactions and a complete description of the computer program input considerations operation and coding
