Term 2006 Organic Chemistry Acs Exam:

Tests in Print Oscar Krisen Buros, 2006 **Materials and Processes for Next Generation Lithography**, 2016-11-08

As the requirements of the semiconductor industry have become more demanding in terms of resolution and speed it has been necessary to push photoresist materials far beyond the capabilities previously envisioned. Currently there is significant worldwide research effort in so called Next Generation Lithography techniques such as EUV lithography and multibeam electron beam lithography. These developments in both the industrial and the academic lithography arenas have led to the proliferation of numerous novel approaches to resist chemistry and ingenious extensions of traditional photopolymers. Currently most texts in this area focus on either lithography with perhaps one or two chapters on resists or on traditional resist materials with relatively little consideration of new approaches. This book therefore aims to bring together the world's foremost resist development scientists from the various community to produce in one place a definitive description of the many approaches to lithography fabrication. Assembles up to date information from the world's premier resist chemists and technique development lithographers on the properties and capabilities of the wide range of resist materials currently under investigation. Includes information on processing and metrology techniques. Brings together multiple approaches to litho pattern recording from academia and industry in one place.
