The respiratory system is made up of

- Nose
- Pharynx (throat)
- Larynx (voice box)
- Trachea (windpipe)
- Bronchi (primary branching from trachea to smaller bronchioles)
- Alveoli

Right and Left Lungs

Our respiratory system has the main part where air enters the body. Internal (anterior) and external (posterior) views.

The nasal cavity is made up of nasal septum, bone and hyaline cartilage. The nasal cavity is made up of nasal septum, bone and hyaline cartilage.

Alveoli (small sacs) where gas exchange occurs. The alveoli are located in the posterior part of the lung.

The mechanisms of respiration involve the contraction and relaxation of the muscles of respiration and the elastic connective tissue.

Mechanisms of Respiration

- During normal quiet breathing the muscles involved are
- Diaphragm
- External intercostal muscles
- Internal intercostal muscles
- External intercostal muscles
- Internal intercostal muscles

- Inhalation** - The muscles of respiration contract and utilize energy to do so, this is an **active** process as it uses energy. Inhalation last approximately 2 seconds.
- Exhalation** - The muscles of respiration relax and the elastic connective tissue pulls the rib cage upwards and outwards.
- The diaphragm contracts when contracted**, increasing the thoracic cavity.
- As the rib cage contracts**, the pressure inside decreases, resulting in **negative pressure**, since the negative pressure is below atmospheric pressure, air is drawn in.
- Exhalation** - A **relaxation** process, doesn't use energy.
- Relaxation of the external intercostal muscles** allows the rib cage to move down and in and the **relaxation of the diaphragm** reduces the size of the thoracic cavity.
- As the rib cage relaxes**, the pressure in the rib cage increases, resulting in **positive pressure**, since it is greater than atmospheric pressure, air is forced out.

- Compliance** - Ease of stretching of the connective tissues in the lungs with increased breathing effort.
- Compliance** - Measure of the distensibility. High compliance, lung will expand easily. Low compliance, lung will not expand to its full capacity.
- Compliance** - Measure of the distensibility. High compliance, lung will expand easily. Low compliance, lung will not expand to its full capacity.

Lung Volumes

- Residual Volume** - the volume of air that remains in the lungs after a normal expiration.
- Tidal Volume** - the volume of air that enters or leaves the lungs during a normal breathing cycle.
- Inspiratory Reserve Volume** - the extra amount of air that can be inhaled into the lungs during a maximal inspiration.
- Expiratory Reserve Volume** - the extra amount of air that can be expired during a maximal expiration.
- Vital Capacity** - the maximum amount of air that can be expired during a maximal expiration.
- Functional Residual Capacity** - the volume of air that remains in the lungs after a normal expiration.
- Total Lung Capacity** - the maximum amount of air that can be inhaled into the lungs during a maximal inspiration.

Respiratory Patterns

- Normal** - normal, unaltered breathing.
- Apnea** - no breathing.
- Hyperventilation** - An abnormally rapid breathing rate of more than 20 breaths per minute.
- Bradypnea** - An abnormally slow rate of breathing.
