- Identify restriction sites.
- Show differences between blunt and sticky (cohesive) end cuts.
- Compare restriction enzyme differences on identical DNA.

Directions: Identify the restriction sites for each of the examples given. Show the cuts, sticky (cohesive) or blunt, number of DNA fragments produced and the number of base pairs in each (count the top row). purified about 20 years ago from *Neisseria gonorrhoeae* MS11. It belongs to the type II P and type II F subtypes. The recognition site of NgoMIV is 5' G CCGGC 3' which is a palindromic sequence. Also, the tetrameric protein has two catalytic cores which means that it will bind with two cognate sites and cut them both. NgoAIV, which was discovered in another strain FA1090 of *Neisseria gonorrhoeae*, is different from NgoMIV protein in two amino acid residues. A hybrid protein called NgoIV<sub>hb</sub> was designed based on the differences. In the thesis study here, the expression of NgoMIV and its mutant was conducted. To uncover the preference of the distance between two recognition sites, digestion tests by applying a plasmid with four recognition sites as substrate were conducted. At last, several proposed mechanisms of catalysis based on the protein motion predicted by anisotropic elastic network model and current existing crystal structures were raised.
