Ixaru, Guido Vanden Berghe, 2004-04-30 Exponential Fitting is a procedure for an efficient numerical approach of functions consisting of weighted sums of exponential trigonometric or hyperbolic functions with slowly varying weight functions This book is the first one devoted to this subject Operations on the functions described above like numerical differentiation quadrature interpolation or solving ordinary differential equations whose solution is of this type are of real interest nowadays in many phenomena as oscillations vibrations rotations or wave propagation The authors studied the field for many years and contributed to it Since the total number of papers accumulated so far in this field exceeds 200 and the fact that these papers are spread over journals with various profiles such as applied mathematics computer science computational physics and chemistry it was time to compact and to systematically present this vast material In this book a series of aspects is covered ranging from the theory of the procedure up to direct applications and sometimes including ready to use programs The book can also be used as a textbook for graduate students

**Tables of the Exponential Function and of the Circular Sine and Cosine to Radian Argument** C. van Orstrand, 2013-10-03 The tables accompanying this paper have been prepared with the

expectation of meeting a twofold requirement The first was to obtain a few high place values at sufficiently small intervals of argument for general use in the evaluation of integrals and other functions the other object was to obtain a basis for subsequent interpolation to small intervals of argument for use in the construction of complete 10 place tables which are applicable in the various fields of pure and applied mathematics The need of tables meeting these and other requirements has been emphasized by various authors The most important tables of extended values of the exponential function in which the exponents are integers or fractions have been constructed by Schulze Bretschneider Newman Gram Glaisher and Burgess Bretschneider included a few high place values of the circular sine and cosine to radian argument but with the exception of these and a few values computed by Gudermann there appears to be no extended values of these important functions Schulze gives values of the ascending exponential at intervals of unity between the limits 1 and 24 inclusive to 28 or 29 significant figures and for the special arguments 25 30 and 60 his values include 32 or 33 figures In so far as I have been able to ascertain Schulze gives no information regarding methods of computation or accuracy of results Glaisher verified the first 15 figures of Schulze's value of  $e^{16}$  by direct substitution in the series the first 13 powers of  $e$  were verified to 22 places of decimals and the values of  $e^{14}$   $e^{15}$   $e^{25}$  to 15 places of decimals by means of the relation
