

## ANTHR 111 (#2542)

### THE VIRTUAL EVOLUTION STICKLEBACK LAB

As you complete each part of the virtual lab, answer the questions below in the space provided.

#### QUESTIONS

##### INTRODUCTION

1. Define "model organism."

A model organism is a species studied to learn about some biological phenomena so that the results of those studies can be applied to other organisms.

2. How do spines protect ocean stickleback fish?

Large predator fish cannot swallow them.

3. How did ancestral populations of ocean-dwelling fish come to live in freshwater lakes?

They were trapped in the lakes that were formed after the ice sheet melted.

4. Watch the video about pelvic reduction in freshwater stickleback. The loss of stickleback pelvic spines is similar to the loss of which body parts in some other four-legged vertebrates?

Hind limbs

5. From a researcher's perspective, what is the benefit of having access to hundreds of postglacial lakes?

They can study how different natural conditions caused different ways the same species evolved.

6. Watch the video with evolutionary biologist Dr. Michael Bell. Why is the threespine stickleback a model organism for studies in evolution? (List at least two reasons.)

Sticklebacks are widespread around the world, so it is easy to collect and study specimens of that species from different environments, and there are a lot of fossilized sticklebacks available, so it is possible to study them in diachronic perspective.

7. Watch the video with Dr. David Kingsley explaining hind-limb reduction. Name two other vertebrate animals whose evolutionary histories included the loss of hind limbs.

Manatees, whales

##### OVERVIEW

1. Click on the interactive stickleback fish. Describe where its spines are located.

There are three spines on the back and two spines on the each side of the pelvic girdle.
