Density

Density is the ratio of the mass of an object to its volume

$$\text{Density} = \frac{\text{Mass}}{\text{Volume}}$$

This equation can be written in different ways to solve for density, mass or volume.

$$D = m/V \quad m = D \times V \quad V = m/D$$

Common units that we use when measuring density:

g/cm³, g/mL, kg/m³, kg/L

If something has a large mass compared to its volume, it has a high density.
This is like a set of weights which can be small but heavy.

But if an object has a small mass compared to its volume it has a lower density.
This is like a piece of wood which can seem light for its size.

Different types of plastic, metal, wood, and other materials have different densities. The density of a material is based on the atoms or molecules the substance is made from. For example, a copper and an aluminum cube of the same volume feel very different when you hold them. The copper cube feels much heavier than the aluminum cube. If you put them on a balance, you see that the copper cube has more mass than the aluminum cube. Since the cubes have the same volume and the copper has a greater mass, the copper cube is more dense than the aluminum cube. This is true since $D = m/v$. If the cubes have the same volume, the one with the greater mass must be more dense.

If you compared the density of a copper cube and a plastic cube of the same volume, the copper is more dense. This is because copper is made from small massive atoms that are packed closely together. This gives copper a fairly high density.

Plastics are made mostly of carbon and hydrogen which are not as massive for their size. They are connected together in long chains and not packed as tightly as the atoms in copper. This makes plastic less dense than copper.

Density in sinking and floating

The density of an object and the density of the liquid it is placed in determine whether an object will sink or float. Even though one object might be heavier than another, the heavy one might float and the lighter one might sink. An example is a small piece of clay and a heavier block of wood placed in water. Even though the wood is heavier than the clay, the wood floats and the clay sinks. This is possible because it's not the mass of the object that matters in sinking and floating but its density compared to the density of water.

An object that is less dense than water will float. An object that is more dense than water will sink. This is why the clay sinks in water and the wood floats. The clay is more dense than water and the wood is less dense than water.
