

## Applications Using Trigonometry

Many problems in daily life can be solved by using trigonometry. Often such problems involve an angle of elevation or an angle of depression.

**Example:** The angle of elevation from point  $A$  to the top of a cliff is  $30^\circ$ . If point  $A$  is 40 feet from the base of the cliff, how high is the cliff?

Let  $x$  represent the height of the cliff.  
Then  $\tan 30^\circ = \frac{x}{40}$ .

$$30 \tan 30^\circ = x$$

This is multiplication, not the degree mode to find  $x$ .

$$\text{ENTER: } 30 \tan 30 = 17.32 \text{ on a calculator}$$

The cliff is about 17 feet high.

**Solve each problem. Round measurements of angles to the nearest degree.**

- From the top of a tower, the angle of depression to a statue on the ground is  $72^\circ$ . The top of the tower is 40 feet above ground. How far is the statue from the base of the tower?
- A tree 40 feet high casts a shadow 60 feet long. Find the measure of the angle of elevation of the tree.
- A ladder leaning against a house reaches an angle of  $60^\circ$  with the ground. The foot of the ladder is 7 feet from the base of the house. How long is the ladder?
- A building on a 40-foot rising incline has an angle of  $30^\circ$  with the ground. How high above the ground is the bottom of the house of the person building the house in direct along the ground?
