

Hydrocarbons containing substituents are called substituted hydrocarbons. Substituents include halogens, groups such as amino, hydroxyl, and cyano, and other functional groups. In this section, we will discuss the hydrocarbons themselves, as well as the functional groups that are attached to them.

Alkanes

Alkanes are hydrocarbons in which the carbon atoms are single-bonded to each other, forming a continuous chain. Alkanes are the simplest hydrocarbons, and they are the most abundant in nature. They are also the most important in industry, as they are the primary source of energy.

Alkanes are classified into three categories: methane, ethane, and propane. Methane is the simplest alkane, consisting of one carbon atom and four hydrogen atoms. Ethane consists of two carbon atoms and six hydrogen atoms. Propane consists of three carbon atoms and eight hydrogen atoms. The general formula for alkanes is C_nH_{2n+2} , where n is the number of carbon atoms. For example, methane has $n=1$, ethane has $n=2$, and propane has $n=3$. The molecular weights of alkanes increase as n increases, and the boiling points also increase. The physical properties of alkanes are determined by the strength of the intermolecular forces, which are the van der Waals forces.

Figure 1.10: The chemical structures of methane, ethane, and propane.

Alkenes

Alkenes are hydrocarbons in which the carbon atoms are double-bonded to each other, forming a continuous chain. Alkenes are the simplest unsaturated hydrocarbons, and they are the most abundant in nature. They are also the most important in industry, as they are the primary source of energy. The general formula for alkenes is C_nH_{2n} , where n is the number of carbon atoms. For example, ethene has $n=2$, propene has $n=3$, and butene has $n=4$. The molecular weights of alkenes increase as n increases, and the boiling points also increase. The physical properties of alkenes are determined by the strength of the intermolecular forces, which are the van der Waals forces.

Alkynes

Alkynes are hydrocarbons in which the carbon atoms are triple-bonded to each other, forming a continuous chain. Alkynes are the simplest saturated hydrocarbons, and they are the most abundant in nature. They are also the most important in industry, as they are the primary source of energy. The general formula for alkynes is C_nH_{2n-2} , where n is the number of carbon atoms. For example, ethyne has $n=2$, propyne has $n=3$, and butyne has $n=4$. The molecular weights of alkynes increase as n increases, and the boiling points also increase. The physical properties of alkynes are determined by the strength of the intermolecular forces, which are the van der Waals forces.
