

POINT LOUSPEAKERS CONNECTIONS

Remove a suitable length of each corresponding cable for each channel, and prepare the ends (see below) for connection to the terminals.

Connect the red (positive (+)) terminal of the left loudspeaker to the corresponding red (positive (+)) amplifier terminal. Connect the black (negative (-)) terminals similarly. Tighten the terminals securely. Repeat this procedure for the right channel.

Using separate cables for both and bass units in a bi-wiring configuration reduces interference effects and improves bass tone and clarity. To do this, you will need to install two equal lengths of two-core cable between the amplifier and each loudspeaker.

Disconnect each terminal of the bass and remove the metal strips. Connect the cables between the amplifier and the loudspeakers as indicated above and be tight on the terminals securely.

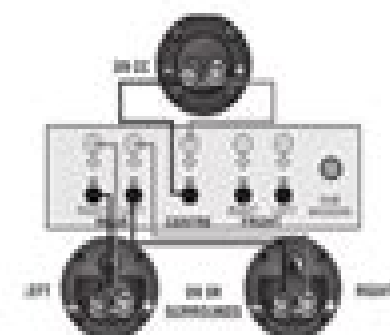

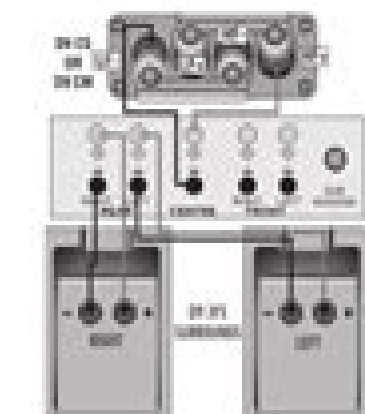

Note: Some amplifiers have two pairs of output terminals to facilitate bi-wiring but this is not essential. The advantages of bi-wiring are fully obtained if your amplifier has one pair of output terminals per channel.

Bi-Amplifying (Bi-Amping)

By connecting each loudspeaker drive unit to its own dedicated amplifier the advantages of bi-wiring can be extended. If you own two identical stereo power amplifiers, your speakers may be bi-amped. For further details please consult your dealer.

CENTRE CHANNEL AND SURROUND LOUSPEAKERS

Connect these speakers as shown below. The Centre channel speaker may be connected as shown, or in series.

Positioning the Front (Stereo) Loudspeakers

The 5.1, 5.1+ and 5.1+ are designed to be floor-standing. We suggest that they are positioned at least 200 mm from the rear walls and 100 mm from the side walls, facing slightly towards the 5.1, 5.1+ and 5.1+ should ideally be placed in a well insulated though they may be placed in a rigid wall. The 5.1+ can be stand or wall mounted. The bass extension will improve if these speakers are positioned closer to the rear wall.

If the loudspeakers are placed too close to the walls the bass will increase but may be less uniform. If the loudspeakers are placed away from the walls, the bass output may be increased by up to 40%, although this may reduce the width of the optimum listening position.

A useful rule of thumb is that the listener should be as far from the loudspeakers as they perform each other. The speakers should ideally be positioned so that the main axis are roughly at an angle to a solid corner. As personal taste plays a large role, experiment with different configurations and play a wide range of programmes before finalising the position of your speakers.

The subwoofer has to be placed with the main speakers. If you place the subwoofer where it amplifies the intelligibility of the music in the main speakers the result will be flawed, coloured tone. If possible, guitar and other noise sounds collected when the subwoofer is operating, and too reduced when it stands, you need to address the positioning first before adjusting the controls.

Loudspeaker Phasing

Make sure that all loudspeakers channels are connected in phase. Testing is most often to what a stereo image is. Stereo image testing: a subwoofer that sends more channels (being out of phase, or stereo, if there is a doubt about the way the loudspeakers are connected, check their phasing by playing a stereo source. The sound should come from a point midway between the two loudspeakers. If this position is unstable, reverse the connections to one of the loudspeakers. Correctly connected loudspeakers give a definite centre sound source with better defined bass and more rhythm.

Setting the Phase of the Subwoofer

Phase at very low frequencies is not straightforward to adjust. Initially we suggest you temporarily set the low pass filter to 'OFF' and the phase to '0°' and play some low frequency music in stereo through the main speakers and the subwoofer. From the listening position, switch the phase between '0°' and '180°'. The setting which appears to give the greatest bass output is correct. Now follow the instructions below for setting the crossover filter.

Home Cinema Systems

Low Pass Filter

If you are using a digital AV processor the subwoofer should be 'OFF' as the processor will have its own bass management system. Most digital AV Processors ask you to specify the size of speakers in the system channels. These are usually 'Large' or 'Small'. The subwoofer bass management for the system. Unless your loudspeakers are large, four channel units, you should choose 'Small' for the front channels, as the subwoofer is going to be better at providing clear, deep bass. Choose 'Small' for the surround channels and for the Centre channel, so that any bass from these channels will be directed to the subwoofer. Set the Subwoofer option on the processor to 'On' or 'Yes'.

After experimenting with various sources you may need to adjust the LPF settings. The goal is to ensure the subwoofer doesn't overwork into the main stage. Setting the subwoofer to 'Small' should reduce the bass extension, but change the bass level - so always personal taste plays an important part.

Setting Levels

Since the loudspeaker settings have been finalised, and the AV amplifier set to 'Yes' mode (see instructions supplied with your processor) adjust the levels and all channels are reproduced at equal levels. When adjusting the subwoofer output level positioning the high a level as you will ensure the music will have what the listening to hear in and may have the subwoofer level to required to change bass extension. Set a variable that going into the subwoofer from the processor. The volume display should be around 50 or 60 when listening to music.

5.1

The channel was originally an additional bass channel with its own dedicated subwoofer. In practice however, if any speakers are set to 'Small', the LFE channel is combined with the bass from those channels and fed into the subwoofer. When you set the LFE level from your AV processor, you can set the LFE channel volume powerful low frequencies which, although normal in a cinema, may disturb a domestic subwoofer. If during a programme you hear popping or thumping noises from the subwoofer, turn the AV Processor volume level down and back up the LFE level. If this does not cure the problem, lower the subwoofer volume level.

Note: If any channels are set to 'Small' the subwoofer must be on, when the system is playing otherwise there will be reduced bass, as well as no LFE.

Source Reproduction

Low Pass Filter The low pass filter should be set 'basing' rather than the sub and low frequency extension of the main speakers. The role of the subwoofer is to extend the bass response of the system rather than the parallel bass level. If the loudspeakers are large, the LPF should be set low - a good second 40 Hz for a good place to start. With smaller speakers this can be increased, up to 80 Hz for very small powered units. At least the first value is determined by listening.

Low level listening

Our aim can be more another is listening frequency (20 kHz) but low frequencies, very low level and especially particularly bass a 'felt' rather than 'heard'. At low level levels, frequencies appear to alternate faster than they change and tend to be felt more. This is a normal part of the human ear and brain's response to sound. The processing unit was done in the 1980s by Pioneer and Marantz who produced a series of 'Small' (Lowpass) (Lowpass) - In conclusion, as they well to know is a normally that part of music at a low level but with attention of the bass information. There may be a case for accepting a preset for low level listening where the subwoofer volume is set somewhat higher and the LPF level of the bass can always be set for individual judgement.

Setting the system by ear

The product may be used for system is to play at a moderate level, more with deep consistent bass. Switching the subwoofer in and out of the system should cause changes of the depth of bass, as the subwoofer will play after. If there is a significant change of bass volume, or a noticeable step in the bass response, or an increase in distortion when the subwoofer is playing, the setup needs to be refined further. By listening different settings in different positions, you will be able readily to identify the most favourable combination.

Using an LFE Meter

This is done with a test disc or signal generator and is beyond the scope of this handbook except to show the LFE meter settings are required 5.1, 5.1+ and 5.1+ - these correspond to the levels of the Pioneer-Model Equalizer (Lowpass) (Lowpass) at 40, 70 and 100 Hz. For normal listening levels, the LFE meter is usually set to '0°' and the response level is set to your wish to use the setup method you should definitely seek your dealer's advice before using.
