The Cell Cycle

What controls the life and development of a cell?

Why?

An old piece of poetry says "to everything there is a season... a time to be born, a time to die." For cells, the line might say "a time to divide and a time to grow." In multicellular organisms, different types of cells have different roles and need to complete specific tasks. For example, a cell that isn't large enough is not useful for storing nutrients for later, but a cell that is too large will not be useful for transportation through a tiny capillary. In this activity, you will learn about the seasons of a cell's life, and in turn better understand how organisms function.

Molecular and Cell Biology of the Plant Cell Cycle J.C. Ormrod,D. Francis,2012-12-06 Considerable advances have been made in our understanding of the eukaryotic cell cycle at the molecular level over the past two decades or so particularly in yeast and in animal systems However only in the past three or four years has progress been made in plants at the molecular level The present volume brings together molecular biologists cell biologists and physiologists to discuss this recent progress and how it relates to our understanding of the regulation of plant growth and development The opening paper summarises the progress which has been made with fission yeast Subsequent papers explore what is known about cell cycle control at the molecular level in plants and about cell cycle regulation in specific physiological systems ending with summary papers on cell division in roots and shoots The book comprises up to date findings on a fundamental aspect of plant growth and development and as such will be of particular interest to advanced undergraduates postgraduates and research scientists in the fields of molecular biology cell biology and physiology
