

ELECTRONEGATIVITY

12. Define electronegativity

The tendency for an atom to attract an e in a chemical bond.

13. How does the ionic radius of a nonmetal compare with its atomic radius?

As you go down a group, electronegativity DECREASES

14. What trend in electronegativity do you see as you go down a group/family on the periodic table?

Think about atomic radius: we know the radius gets bigger as you go down a group, so the valence shell gets further from the attractive force (p) in the nucleus, so the valence shell feels a weaker attractive force, and e aren't as easily pulled in.

15. What causes this trend?

Think about atomic radius: we know the radius gets bigger as you go down a group, so the valence shell gets further from the attractive force (p) in the nucleus, so the valence shell feels a weaker attractive force, and e aren't as easily pulled in.

16. What trend in electronegativity do you see as you go across a period/row on the periodic table?

As you go across (L>R) a period, electronegativity INCREASES.

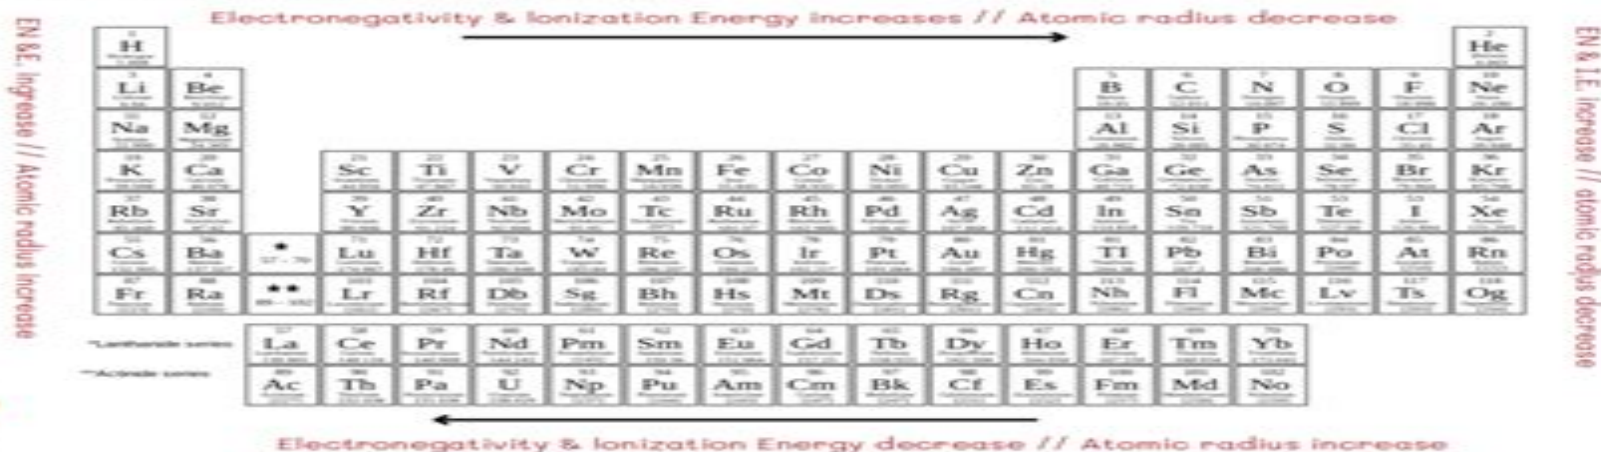

17. What causes this trend?

Think about atomic radius: more p* create a stronger attractive force, causing the e to be held more closely to the nucleus. Since the valence shell is closer to that (stronger) attractive force, it is easier to pull in e from other atoms.

18. Circle the atom in each pair that has the greater electronegativity.

a) Ca (Ga) b) Li (O) c) (Cl) S d) (Br) As e) Ba (Sr)

Instructions Below the diagram, create a key that connects arrows with the following periodic trends: electronegativity, ionization energy, and atomic radius. Specify "increasing" or "decreasing" for each trend. More than one trend can be associated with each arrow.
