Let $f(x) = 16x^4 - 24x^2 + 4$. Graph f and g on the same coordinate plane. Describe g as a transformation of f .

$$g(x) = f\left(\frac{1}{2}x\right)$$

$$g(x) = 16\left(\frac{1}{2}x\right)^4 - 24\left(\frac{1}{2}x\right)^2 + 4$$

$$g(x) = x^4 - 3x^2 + 4$$

$g(x)$ is a horizontal stretch of $f(x)$.

In an age of explosive worldwide growth of electronic data storage and communications effective protection of information has become a critical requirement When used in coordination with other tools for ensuring information security cryptography in all of its applications including data confidentiality data integrity and user authentication is a most powerful tool for protecting information This book presents a collection of research work in the field of cryptography It discusses some of the critical challenges that are being faced by the current computing world and also describes some mechanisms to defend against these challenges It is a valuable source of knowledge for researchers engineers graduate and doctoral students working in the field of cryptography It will also be useful for faculty members of graduate schools and universities

Fourier Transform Spectrometry Sumner P. Davis,Mark C. Abrams,James W. Brault,2001-05-30 Fourier Transform

Spectrometry is of immediate use to those who use Fourier transform spectrometers in their research or are considering their use The authors presentations enable readers to obtain a clear understanding of FTS which is crucial to their studies and research Due to the increasing complexity and commercialization of instrumentation achieving optimum performance in research applications and automated usage can be challenging For example a thorough understanding of the instrument can dramatically affect the outcome of the experiment and the generation of reliable data in applications where conditions are not ideal and resulting signals are weak This book provides a comprehensive discussion of FTS from the ground up covering basic concepts instrumentation data processing algorithms and techniques for computerized spectral analysis AP

Coloring Algorithm Ashay Dharwadker,2006-08-08 We present a new polynomial time algorithm for finding proper m

colorings of the vertices of a graph We prove that every graph with n vertices and maximum vertex degree Δ must have chromatic number $\chi(G)$ less than or equal to $\Delta + 1$ and that the algorithm will always find a proper m coloring of the vertices of G with m less than or equal to $\Delta + 1$ Furthermore we prove that this condition is the best possible in terms of n and Δ by explicitly constructing graphs for which the chromatic number is exactly $\Delta + 1$ In the special case when G is a connected simple graph and is neither an odd cycle nor a complete graph we show that the algorithm will always find a proper m coloring of the vertices of G with m less than or equal to Δ In the process we obtain a new constructive proof of Brooks famous theorem of 1941 For all known examples of graphs the algorithm finds a proper m coloring of the vertices of the graph G for m equal to the chromatic number $\chi(G)$ In view of the importance of the P versus NP question we ask does there exist a graph G for which this algorithm cannot find a proper m coloring of the vertices of G with m equal to the chromatic number $\chi(G)$ The algorithm is demonstrated with several examples of famous graphs including a proper four coloring of the map of India and two large Mycielski benchmark graphs with hidden minimum vertex colorings We implement the algorithm in C and provide a demonstration program for Microsoft Windows
