

Transpiration

A researcher used three leaves from the same plant through a stomachograph. They counted the number of stomata on the top and bottom of each leaf. Their results are shown in the table.

Surface of leaf	Number of stomata per mm ²			Total Number of stomata per leaf
	Leaf 1	Leaf 2	Leaf 3	
Top	25	32	38	
Bottom	200	175	200	

1. Compare the table by calculating the total number of stomata for each surface of the leaf.

2. Why are there more stomata on the underside of the leaf?

For each box:

- ☐ To reduce the humidity that gets in there.
- ☐ To reduce the evaporation of water.
- ☐ To increase the evaporation of water.
- ☐ To increase gas exchange.

3. What is the name of the cells that open and close the stomata?

4. How are the leaf cells protected in the correct way?

Factors That Affect Transpiration

Transpiration is the evaporation of water from a plant's leaves. It shows the importance of water through a plant. The movement involves the absorption and transport of mineral ions that it needs for healthy growth. There are lots of factors that affect the rate of transpiration.

The Effect of Plant Adaptations

Many plants have adaptations that help them to photosynthesize as much as possible while losing as little water as possible.

The thickness of a cuticle that leaves have is a key factor on their top surface that prevents excessive water loss. Plants that live in hot, dry environments have thicker cuticles.

The number of stomata (pores) on the bottom of leaves is greater than the top. This helps to reduce water loss. The more stomata a plant has the more water that evaporates when they are open, so right where there is no photosynthesis, most plants close their stomata to reduce water loss.

Plants with thick cuticles and few stomata on their top surface are adapted to hot, dry environments.

Plants with many stomata on their bottom surface are adapted to hot, dry environments. They have many stomata on their bottom surface to allow them to take in carbon dioxide and release oxygen.
